HP 8592A Portable Microwave Spectrum Analyzer
Installation Manual

Serial Numbers

This manual applies directly to analyzers with serial numbers prefixed through 2736A.

For additional important information about serial numbers, see "Analyzers Covered By This Manual" in Chapter 1.

Manual Part Number: HP PN 08592-90003
Microfiche Part Number: 08592-90004

HP 8592A Documentation Description

Manuals shipped with your analyzer:  You are here!

Installation Manual*
HP Part Number 08592-90003
- Tells you how to install the spectrum analyzer
- Tells you what to do in case of a failure

Operating Manual*
HP Part Number 08592-90005
- Tells you how to make measurements with your spectrum analyzer
- Describes analyzer features

Options:

Support Manual (HP 8592A Option 915)**
HP Part Number 08592-90008
- Describes troubleshooting and repair of the analyzer

Programming Manual
HP Part Number: 08592-90010 (HP 8592A Option 021, 022, 023)
- Describes analyzer operation via a remote controller (computer)

* Additional copies of the Operating Manual and the Installation Manual are not available separately; together, they constitute the HP 8592A Documentation Package and must be ordered by its HP Part Number — 08592-90001.

How to Use This Manual

Where to Start

If you have just received the HP 8592A and want to get it ready to use for the first time:

Skim Chapter 1, "Introducing the Spectrum Analyzer," for a brief introduction to the unit and its capabilities.

Thoroughly read Chapter 2, "Preparation for Use," and follow its instructions for:

- unpacking the unit
- preparing it for use
- performing initial calibration routines and a confidence test to get a quick indication that the unit is ready for operation (these are automatic self-checks and require no test equipment).

If you need to verify the unit is operating within its specifications, perform the Operation Verification tests in Chapter 3, "Verifying Specified Operation."

Then use the Operating Manual to learn how to use the analyzer.

If the analyzer has been in use and you want to verify that it is operating correctly or to solve an apparent problem:

Perform the calibration routines and confidence test procedure given in Chapter 2, "Preparation for Use," for a quick indication of proper operation.

If you have the necessary test equipment, perform the Operation Verification tests in Chapter 3, "Verifying Specified Operation," to verify that the unit is operating within its specifications.

If there is an apparent problem, read Chapter 4, "If Something Goes Wrong ...," for hints on what may be wrong and how to solve the problem, and instructions for calling HP for additional help.
Manual Terms and Conventions

Words in this manual that appear CAPITALIZED in [BRACKETS] refer to softkeys that appear on the screen. Keys that appear on the front panel of the instrument appear in BOLD ITALICS.

Printing History

Each new edition of this manual incorporates all material updated since the previous edition. Manual change sheets may be issued between editions, allowing you to correct or insert information in the current edition.

The part number of this manual changes only when a new edition is published. Corrections or additions may be made as the manual is reprinted between editions.

Index
Safety Symbols

The following safety symbols are used throughout this manual and in the instrument. Familiarize yourself with each of the symbols and its meaning before operating this instrument.

⚠ Instruction manual symbol. The instrument will be marked with this symbol when it is necessary for the user to refer to the instruction manual in order to protect the instrument against damage. Location of pertinent information within the manual is indicated by use of this symbol in the table of contents.

⚡ Indicates dangerous voltages are present. Be extremely careful.

⚠️ The CAUTION symbol denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in damage to or destruction of the instrument. Do not proceed beyond a CAUTION symbol until the indicated conditions are fully understood and met.

⚠️ The WARNING symbol denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in injury or loss of life. Do not proceed beyond a WARNING symbol until the indicated conditions are fully understood and met.
General Safety Considerations

**WARNING**

BEFORE THIS INSTRUMENT IS SWITCHED ON, make sure it has been properly grounded through the protective conductor of the ac power cable to a socket outlet provided with protective earth contact. Any interruption of the protective (grounding) conductor, inside or outside the instrument, or disconnection of the protective earth terminal can result in personal injury.

**WARNING**

There are voltages at many points in the instrument which can, if contacted, cause personal injury. Be extremely careful. Any adjustments or service procedures that require operation of the instrument with protective covers removed should be performed only by trained service personnel.

**CAUTION**

BEFORE THIS INSTRUMENT IS SWITCHED ON, make sure its primary power circuitry has been adapted to the voltage of the ac power source. Failure to set the ac power input to the correct voltage could cause damage to the instrument when the ac power cable is plugged in.
Electrostatic Discharge

Electrostatic discharge (ESD) can damage or destroy electronic components. Therefore, all work performed on assemblies consisting of electronic components should be done at a static-free work station.

Figure 1 is an example of a static-safe work station using two types of ESD protection:

- conductive table mat and wrist-strap combination
- conductive floor mat and heel-strap combination

These methods may be used together or separately.

Figure 1. Example of a Static-Safe Work Station
Reducing Damage Caused by ESD

Following are suggestions that may help reduce ESD damage that occurs during testing and servicing operations.

- Before connecting any coaxial cable to an analyzer connector for the first time each day, momentarily ground the center and outer conductors of the cable.

- Personnel should be grounded with a resistor-isolated wrist strap before touching the center pin of any connector and before removing any assembly from the unit.

- Be sure that all instruments are properly earth-grounded to prevent a buildup of static charge.

Static-Safe Accessories

Table 1 lists static-safe accessories that can be obtained from Hewlett-Packard by using the HP part numbers shown.

Figure 1-1. The HP 8592A Spectrum Analyzer
CHAPTER 1

INTRODUCING THE SPECTRUM ANALYZER

What You’ll Find in This Chapter

This chapter introduces you to the HP 8592A Spectrum Analyzer and its options and accessories that tailor the unit to your specific needs. To acquaint you with the analyzer’s full capabilities, the HP 8592A specifications and characteristics are also provided.

Introducing the Spectrum Analyzer

The HP 8592A Spectrum Analyzer is a small, lightweight test instrument that combines a wide frequency range (50 kHz to 22 GHz) and amplitude range (—109 dBm to +30 dBm) with over 100 easy-to-use functions to handle just about any RF or Microwave signal measurement. Its portability and easy, highly automatic operation make it ideal for service and troubleshooting use in R&D labs and in manufacturing and service environments in the CATV, mobile radio, and related communications businesses.

The analyzer is a complete, self-contained instrument that needs only an external ac power source for operation. An ac power cable, suitable for use in the country to which the analyzer is originally shipped, is included with the unit. Also included is an HP 10502A BNC cable 20 cm (9 inch) (HP PN 8120-2682), a type N (m) to BNC (f) adapter (HP PN 1250-0780), and a type SMA (m) to BNC (f) adapter (HP PN 1250-1200).
Options and Accessories Available

Options

Many options are available to tailor the analyzer to your needs. Options can be ordered by option number when you order the analyzer. Some of the options are also available as kits that can be ordered and installed after you have received your analyzer.

**HP-IB (Option 021):** Option 021 enables you to control your analyzer from a computer that uses an HP-IB interface bus. Such computers include the HP 200 and HP 300 series and the HP Vectra PC. The option also enables the analyzer to control a printer or plotter. Option 021 includes an HP-IB connector on the rear panel and an HP-IB Programming Manual.

Option 021 is also available as a kit (HP Part Number 08590-60052). The kit includes a printed circuit board, connector, manual, and installation instructions.

**HP-IL (Option 022):** Option 022 enables you to control your analyzer from a computer that uses an HP-IL interface bus. Such computers include the HP-71 and the HP-75. The option also enables the analyzer to control a printer or plotter. Option 022 includes an HP-IL connector on the rear panel and an HP-IL Programming Manual.

Option 022 is also available as a kit (HP Part Number 08590-60053). The kit includes a printed circuit board, connector, manual, and installation instructions.

**RS-232 (Option 023):** Option 023 enables you to control your analyzer from a computer that uses an RS-232 interface bus. Such computers include the HP Vectra PC, the IBM PC, XT, and AT, and compatibles. The option also enables the analyzer to control a printer or plotter. Option 023 includes an RS-232 connector on the rear panel and an RS-232 Programming Manual.

Option 023 is also available as a kit (HP Part Number 08590-60054). The kit includes a printed circuit board, connector, manual, and installation instructions.

**Front-Panel Cover (Option 040):** The front-panel cover snaps onto the front of your analyzer to protect the front panel during travel and when the unit is not in use. The cover has a recessed area in which you can store the Operating Manual, a programming manual, or an HP-71 Handheld Computer.

Option 040 is also available as a kit (Impact Cover Assembly, Deep; HP Part Number 5062-0792).

**Rack Mount Flange Kit (Option 908):** This option provides the parts necessary to mount the analyzer in an HP System II cabinet or in a standard 19-inch (482.6-mm) equipment rack.

Option 908 is also available as a kit (HP Part Number 5062-0800).

**Rack Mount Flange Kit With Handles (Option 909):** Option 909 is the same as option 908 but includes front handles for added convenience.
Option 909 is also available as a kit (HP Part Number 5062-1900).

**Operating and Installation Manuals (Option 910):** An additional copy of the Operating Manual and the Installation Manual are available as a set under Option 910. This set is called the Documentation Package, and has HP Part Number 08592-90001.

**Service Documentation (Option 915):** Option 915 includes one copy of the Operating Manual, the Installation Manual, and the Support Manual. This set is called the Support Package and has HP Part Number 08592-90007.

**Accessories**

A number of accessories are available from Hewlett-Packard to help you configure your analyzer for your specific needs.

![CAUTION]

Do not use dc-coupled probes; they may cause damage to the analyzer input circuit.

**Broadband Preamplifier:** The HP 8447D Preamp provides a minimum of 26 dB gain from 100 kHz to 1300 MHz to enhance measurements of very low-level signals.

**Close Field Probe:** The HP 11940A/11941A Close-Field Probes are small, handheld, electromagnetic-field sensors. The probes provide repeatable, absolute, magnetic-field measurements from 30 MHz to 1 GHz with the 11940A, and from 9 kHz to 30 MHz with the 11941A. When attached to a source, the probes generate a localized magnetic field for electromagnetic interference (EMI) susceptibility testing.

**Computer:** The HP-71 Handheld Computer is a powerful, readily portable computational tool well suited to test instrument control. It uses a powerful BASIC language that allows structured programming techniques. It can be used to control the analyzer through the HP-IL interface (Option 022).

**Monitor:** The HP 82913A is a 12-inch monitor that provides a larger display for the analyzer in fixed installations.

**Plotter:** The HP ColorPro 7440A Graphics Plotter adds a color printout capability to the analyzer for permanent records of important measurements. The eight-pen HP ColorPro Plotter produces color plots with 0.025-mm (0.001-in.) resolution on either 8.5 x 11-inch paper or transparency film. The plotter can be ordered with HP-IB or RS-232 interfaces to correspond to the interface option installed on the analyzer.
Printer: The HP 2225A ThinkJet Personal Printer provides fast, quiet, portable printing with graphics capability for another form of permanent records of your test results. The printer can be ordered with HP-IB, HP-IL, or RS-232 interfaces to correspond to the interface option installed on the analyzer.

Rack Slide Kit: This kit (HP Part Number 1494-0060) provides the hardware to adapt Rack Mount Kits (Options 908 and 909) for mounting the analyzer on slides in an HP System II cabinet.

RF Limiter: The HP 11867A Limiter protects the analyzer input circuits from damage due to high power levels. It operates over a frequency range of dc to 1800 MHz and begins reflecting signal levels over 1 milliwatt up to 10 watts average power and 100 watts peak power.

Transit Case: The transit case (HP Part Number 9211-5604) provides extra protection for your analyzer for frequent travel situations. The HP transit case protects your instrument from hostile environments, shock, vibration, moisture, and impact while providing a secure enclosure for shipping.

50-ohm/75-ohm Minimum-Loss Pad: The HP 11852B is a low VSWR minimum-loss pad that is required for measurements on 75-ohm devices. It is effective over a frequency range of DC to 2 GHz.

75-ohm Matching Transformer: The HP 11694A allows you to make measurements in 75-ohm systems while retaining amplitude calibration. It is effective over a frequency range of 3 to 500 MHz.
Analyzers Covered By This Manual

This manual applies to analyzers with the serial number prefixes listed under SERIAL NUMBERS on the title page.

Serial Numbers

Hewlett-Packard makes frequent improvements to its products to enhance their performance, usability, or reliability, and to control costs. HP service personnel have access to complete records of design changes to each type of equipment, based on the equipment's serial number. Whenever you contact HP about your analyzer, have the complete serial number available to ensure obtaining the most complete and accurate information possible.

A mylar serial number label is attached to the rear of the analyzer. The serial number has two parts: the prefix (the first four numbers and a letter), and the suffix (the last five numbers). See Figure 1-2.

![Figure 1-2. Typical Serial Number Label]

The first four numbers of the prefix are a code that identifies the date of the last major design change that is incorporated in your analyzer. The letter identifies the country in which the unit was manufactured. The five-digit suffix is a sequential number and is different for each unit. Whenever you list the serial number or refer to it in obtaining information about your analyzer, be sure to use the complete number, including the full prefix and the suffix.
Specifications and Characteristics

Specifications describe the warranted analyzer performance over the temperature range of 0° to +55°C, unless otherwise stated. All specifications apply after the unit has reached a stable operating temperature as defined by the Temperature Stability Specification, and when functions are coupled (AUTO COUPLE key), and after calibration routines have been run, if required.

Characteristics provide useful information in the form of typical, nominal, or approximate values for analyzer performance.

Specifications

The analyzer specifications are listed in Table 1-1. Specifications apply in single frequency bands, and are typical for multiple bands.

</table>

**Frequency Specifications**

Frequency Range is covered in the following bands:
- 3 GHz to 22 GHz
- 50 kHz to 2.9 GHz
- 2.75 GHz to 6.2 GHz
- 6.0 GHz to 12.8 GHz
- 12.4 GHz to 19.4 GHz
- 19.1 GHz to 22 GHz

**Frequency Accuracy**

Readout Accuracy (Tuning Accuracy)
- ± (2% of frequency span + 5 MHz), from 50 kHz to 2.75 GHz
- ± (2% of frequency span + 0.2% of center frequency), from 2.75 GHz to 22 GHz

Resolution
- 4 digits

**Frequency Spans**

Full Span with 4-digit resolution
- 0 GHz to 2.9 GHz
- 2.75 GHz to 22 GHz

Zero Span
- Analyzer functions as a manually tuned receiver, at the frequency indicated by the CENTER FREQUENCY readout, for time domain display of signal modulation

Frequency Span Readout Accuracy
- | ± 2% of indicated frequency span | > 17 MHz |
- | ± 5% of indicated frequency span | ≤ 17 MHz |

**Frequency Sweep**

Automatic (AUTO)
- Sweep times from 20 milliseconds to 100 seconds, adjusted automatically to maintain absolute amplitude calibration for any combination of frequency span, resolution bandwidth, and video filter bandwidth

Readout Accuracy
- ± 10% of indicated sweep time setting

CHAPTER 2
PREPARATION FOR USE

What You’ll Find in This Chapter

This chapter describes the process of getting the Spectrum Analyzer ready to use. The process includes initial inspection procedures, setting up the unit for the selected ac power source, and performing automatic calibration routines and a confidence test to indicate that the unit is operating correctly.

Getting Ready

Initial Inspection

Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, keep it until you have verified that the contents are complete and you have tested the analyzer mechanically and electrically.

The contents of the shipment should be as shown in Figure 2-1 and its accompanying legend. If the contents are incomplete or if the analyzer does not pass the operation verification tests (procedures are provided in Chapter 3), notify the nearest Hewlett-Packard office. If the shipping container is damaged or the cushioning material shows signs of stress, also notify the carrier. Keep the shipping materials for the carrier’s inspection. The HP office will arrange for repair or replacement without waiting for a claim settlement.

If the shipping materials are in good condition, retain them for possible future use. You may wish to ship the analyzer to another location or to return it to Hewlett-Packard for service. See “How to Return Your Analyzer for Servicing.”

Preparing the Analyzer for Use

The analyzer is a portable instrument and requires no physical installation other than connection to a source of ac power.

CAUTION

DO NOT connect ac power until you have verified that the line voltage is correct, the proper fuse is installed, and the line voltage selector switch is properly positioned, as described in the following paragraphs. Damage to the equipment could result.

Note: Complete instructions for installing your analyzer in an equipment rack are provided in a Service Note that is included with Options 908 and 909 Rack Mounting Kits.

Figure 2-1. Analyzer Shipping Container and Contents
Setting the Line Voltage Selector Switch

**CAUTION**

BEFORE CONNECTING the analyzer to the power source, you must set the rear-panel voltage selector switch correctly to adapt the analyzer to the power source. An improper selector switch setting can damage the analyzer when it is turned on.

Set the instrument’s rear-panel voltage selector switch to the line voltage range (115V or 230V) corresponding to the available ac voltage. See Figure 2-2. Insert a small screwdriver or similar tool in the slot and slide the switch up or down so that the proper voltage label is visible.

![Figure 2-2. Setting the Voltage Selector Switch](image)

Checking the Fuse

**Note:** The ac line input fuse is the same value regardless of the input line voltage. It is a fast-blow fuse, rated at 6.3A, 250V; its HP part number is 2100-0703.

The line fuse is housed in a small container immediately above the rear-panel power connector (see Figure 2-3). The container provides space for storing a spare fuse, as shown in the figure.

To check the fuse, insert the tip of a screwdriver in the slot at the bottom of the container and pry gently to remove the container. If the fuse is defective or missing, install a new fuse in the proper position and reinsert the fuse container.

![Figure 2-3. Checking the Line Fuse](image)
Power Cable

The analyzer is equipped with a three-wire power cable, in accordance with international safety standards. When connected to an appropriate power line outlet, this cable grounds the instrument cabinet.

**WARNING**

Failure to ground the analyzer properly can result in personal injury. Before turning on the analyzer, you must connect its protective earth terminals to the protective conductor of the main power cable. Insert the main power cable plug only into a socket outlet that has a protective earth contact. DO NOT defeat the earth-grounding protection by using an extension cable, power cable, or autotransformer without a protective ground conductor. If you are using an autotransformer, make sure its common terminal is connected to the protective earth contact of the power source outlet socket.

Various power cables are available to connect the analyzer to the types of ac power outlets unique to specific geographic areas. The cable appropriate for the area to which the analyzer is originally shipped is included with the unit. You can order additional ac power cables for use in different areas. Table 2-2 lists the available ac power cables, illustrates the plug configurations, and identifies the geographic area in which each cable is appropriate.

**Power Requirements**

The power requirements for the analyzer are listed in Table 2-1.

* Part number shown for plug is industry identifier for plug only. Number shown for cable is HP Part Number for complete cable, including plug.
** E = Earth Ground; L = Line; N = Neutral.
Turning the Analyzer On for the First Time

When you turn the analyzer on for the first time, you should perform frequency and amplitude calibration routines to calibrate and indicate that the unit is functioning correctly. These are automatic self-tests that are completed in less than 15 minutes and require no external test equipment.

Perform the following steps:

1. Press **LINE**.

   After a few seconds, the screen displays the analyzer’s model number (HP 8592A), and the firmware date (for example, 10.9.86 indicates September 10, 1986).

   **CAUTION**

   DO NOT exceed the maximum input power. The maximum input power is +30 dBm (1 watt) continuous; 0 volt dc.

   **Note:** Record the firmware date and keep it for reference. If you should ever need to call HP for service or with any questions regarding your analyzer, it will be helpful to have the firmware date readily available.

   If your analyzer is equipped with Option 021 (HP-IB interface) or Option 022 (HP-I interface), the appropriate interface address (HP-IB ADRS: XX or HP-IL ADRS: XX) also appears on the screen. If your analyzer is equipped with Option 023 (RS-232 interface), the baud rate (RS232: XXXX) is displayed.

2. Allow the analyzer to warm up in accordance with the Temperature Stability specification in Table 1-1.

3. Connect a 50-ohm coaxial cable, such as HP 10502A, and a BNC/type N to type N adapter between the front-panel CAL OUTPUT and the analyzer INPUT connectors.

4. Perform the frequency calibration routine by pressing **CAL** and [CAL FREQ].

   **CAUTION**

   Do not press [CAL FREQ] or [CAL AMPTD] when the CAL OUTPUT is not connected to the analyzer INPUT.

   During the routine, **CAL: SWEEP, CAL: FREQ, CAL: SPAN, CAL: SWEEP DELAY** and **CAL: 2nd LO** are displayed as the sequence progresses. **CAL: DONE** appears when the routine is completed. Any failures or discrepancies produce a message on the screen; see Appendix A for descriptions of screen messages.
5. Perform the amplitude calibration routine by pressing [CAL AMPTD].

During the routine, **CAL: AMPTD**, **CAL: 3 dB BW**, **CAL: ATTN**, and **CAL: LOGAMP** are displayed as the sequence progresses. **CAL: DONE** appears when the routine is completed. Any failures or discrepancies produce a message on the screen; see Appendix A.

6. When the frequency and amplitude calibration routines have been completed successfully, store the data by pressing [CAL STORE].

The calibration routines calibrate the analyzer by generating correction factors. [CAL STORE] stores the calibration correction factors in non-volatile memory; the analyzer will automatically apply these factors in future measurements.

**CAUTION**

Do not press [CAL STORE] if any of the calibration routines are not successfully completed per the above procedure. Press **CAL** and [CAL FETCH] to retrieve the previous calibration data if any of the calibration routines are interrupted such as by pressing **PRESET**. Press **PRESET**, **CAL** and [CAL FETCH] to retrieve the previous calibration data if [CAL FREQ] or [CAL AMPTD] is accidentally pressed when the CAL OUTPUT is not connected to the analyzer INPUT.

When the calibration routines have been completed successfully, the analyzer is ready for normal operation.
CHAPTER 3

VERIFYING SPECIFIED OPERATION

What You'll Find in This Chapter

This chapter contains five test procedures which test the electrical performance of the Spectrum Analyzer. Collectively, these tests are called Operation Verification.

What is Operation Verification?

Operation Verification verifies that performance is within the most critical specifications of Table 1-1. The following tests are included in Operation Verification:

- Calibrator Amplitude And Frequency Accuracy
- Displayed Average Noise
- Frequency Span Readout Accuracy
- Frequency Readout Accuracy
- Frequency Response Flatness

Operation Verification takes less than one hour. You can use Operation Verification as a quick incoming inspection test or as a partial calibration test. If the analyzer passes Operation Verification, there is an 80% confidence level that it meets all its specifications.

The highest level test, called a Performance Verification test, is an in-depth test that verifies that performance is within all specifications of Table 1-1. This test is time consuming and requires extensive test equipment. It is documented in the Support Manual; see "Service Documentation (Option 915)" in Chapter 1 for ordering information.

None of the test procedures described above involve removing the cover of the spectrum analyzer.
Before You Start Operation Verification

There are four things you must do before starting Operation Verification:

1. Switch the analyzer on and let it warm up in accordance with the Temperature Stability specification in Table 1-1.

2. Read Chapter 1 of the Operating Manual, "Making Your First Measurement."

3. After the analyzer has warmed up as specified, perform the Calibration Procedure documented in "Making Your First Measurement." The performance of the analyzer is only specified after the analyzer calibration routines have been run and if the analyzer is auto-coupled.

4. Read the rest of this section before you start any of the tests, and make a copy of the Operation Verification Test Record described below.

Test Equipment You'll Need

Table 3-1 lists the recommended test equipment for Operation Verification. Any equipment that meets the critical specifications given in the table can be substituted for the recommended model(s).

Accessories You Should Have

Table 3-2 lists a number of accessories used during Operation Verification.
Recording the Test Results

A small test results table is provided at the end of each test procedure for your convenience in recording test results as you perform the procedure.

In addition, a complete Operation Verification Test Record form is provided as Table 3-9 at the end of the chapter. We recommend that you make a copy of this table, record the complete test results on the copy, and keep the copy for your calibration test record. This record could prove valuable in tracking gradual changes in test results over long periods of time.

If the Analyzer Doesn't Meet Specifications

If the analyzer doesn't meet one or more of the specifications, complete any remaining Operation Verification tests and record all test results on a copy of the test record. Then refer to Chapter 4, "If Something Goes Wrong...," for instructions on how to solve the problem.

Periodically Verifying Operation

The analyzer requires periodic verification of operation. Under most conditions of use, you should test the analyzer at least once a year with either Operation Verification or the complete set of Performance Tests.

Verification Tests

Calibrator Amplitude and Frequency Accuracy

This test measures the accuracy of the analyzer’s calibrator signal. The analyzer uses this signal in its calibration routines. Therefore, the calibration of the analyzer depends on the accuracy of this signal. The calibrator signal is measured directly using a power meter for amplitude accuracy and a frequency counter for frequency accuracy.

Specification

Amplitude: —20 dB±1.0 dB
Frequency: 299.9 MHz ±300 kHz

Recommended Equipment

- Frequency Counter: ......................... HP 5383A
- Power Meter: ............................... HP 436A
- Power Sensor: .............................. HP 8482A
- BNC cable: ................................. HP Part Number 8120-1839

Test Procedure

1. Press **PRESET** on the analyzer.
2. Calibrate the power meter and power sensor.
3. Connect the power sensor to the CAL OUTPUT of the analyzer.
4. Record the power reading on a copy of the test record. The power reading should be between the values shown on the test record.
5. Set the frequency counter input impedance to 50 ohms and the gate time to MHz.
6. Connect the analyzer's CAL OUTPUT to the input of the frequency counter.
7. Record the frequency reading of the counter on copies of Table 3-3, Calibrator Amplitude and Frequency Accuracy, and Table 3-9, Operation Verification Test Record. The frequency reading should be between the values shown on the tables.

**Test Results**

<tr>
<td>299.9 MHz</td>
<td>299.6 MHz</td>
</tr>
</tbody>
</table>
Displayed Average Noise

This test measures the noise generated by the circuits of the analyzer. This noise, called average noise, affects the analyzer's ability to measure small signals. The lower the average noise level, the greater the sensitivity and dynamic range.

This test uses the marker to measure the displayed noise with no input signal present. Since the noise measured by this test is internal to the analyzer, it is not affected by the input attenuator. However, the input attenuator setting is coupled to the displayed amplitude level. Therefore, the input attenuator must be set to 0 dB to get an accurate amplitude reading of the noise.

Specification

Maximum average noise level with 0-dB in/out attenuation, 1-kHz resolution bandwidth, and 30-Hz video bandwidth:

<table>
<thead>
<tr>
<th>Noise Level</th>
<th>Frequency Range</th>
</tr>
</thead>
<tbody>
<tr>

<td>&lt;=-87 dBm</td>
<td>19.1-22 GHz</td>
</tr>
</tbody>
</table>

Recommended Equipment

50 Ohm Termination (BNC) ........................................... HP 11593A

Test Procedure

1. Connect the 50 ohm termination to the analyzer INPUT of the analyzer.

   50 kHz to 5 MHz  <=-90 dBm —(0.00038% of CF)
   5 MHz to 2.9 GHz <=-109 dBm

2. Press the following analyzer keys:
   PRESET (wait until the preset is complete)
   SPAN 0 HZ
   SWP BW [RES BW] 1 kHz
   [VID BW] 3 0 Hz
   AMPLITUDE 8 0 —dBm
   ATTEN 0 dB
   FREQUENCY 4 0 0 kHz
3. Press the following analyzer keys:
   TRIG [SINGLE SWEEP]
   MKR
   PEAK SEARCH

4. Read the average noise level as the marker amplitude.

5. Repeat steps 3 and 4 for the analyzer frequencies (10 MHz, 1450 MHz and 2900 MHz) shown in Table 3-4.

6. Record the test results in Table 3-4, Displayed Average Noise, and in Table 3-9, Operation Verification Test Record.

2.75 to 6.2 GHz $\leq$ $-105$ dBm

7. Press the following analyzer keys:
   PRESET
   [HRM LOCK] [2.75-6.2 BAND 1]
   SPAN 0 HZ
   SWP/BW [RES BW] 1 kHz
   [VID BW] 3 0 Hz
   AMPLITUDE 8 0 $-$dBm
   [ATTEN] 0 dB
   FREQUENCY 2 7 0 0 MHz

8. Press the following analyzer keys:
   TRIG [SINGLE SWEEP]
   MKR
   PEAK SEARCH

9. Read the average noise as the marker amplitude.

10. Repeat steps 8 and 9 for frequencies 4500 and 6200 MHz.

11. Record the test results in Table 3-4, Displayed Average Noise, and in Table 3-9, Operation Verification Test Record.

6.0 to 12.8 GHz $-$99 dBm

12. Press the following analyzer keys:
   PRESET
   [HRM LOCK] [6.0-12.8 BAND 2]
   SPAN 0 HZ
   SWP/BW [RES BW] 1 kHz
   [VID BW] 3 0 Hz
   AMPLITUDE 8 0 $-$dBm
   [ATTEN] 0 dB
   FREQUENCY 6 0 0 0 MHz
13. Press the following analyzer keys:
   TRIG [SINGLE SWEEP]
   MKR
   PEAK SEARCH

14. Read the average noise as the marker amplitude.

15. Repeat steps 12 through 14 for frequencies 9250 MHz and 12800 MHz.

16. Record the test results in Table 3-4, Displayed Average Noise, and in Table 3-9, Operation Verification Test Record.

12.4 to 19.4 GHz <-92 dBm

17. Press the following analyzer keys:
   PRESET
   [HRM LOCK] [12.4-22 BAND 3]
   SPAN 0 Hz
   SWP/BW [RES BW] 1 kHz
   [VID BW] 3 0 Hz
   AMPLITUDE 7 0 —dBm
   [ATTEN] 0 dB
   FREQUENCY 1 2 4 0 0 MHz

18. Press the following analyzer keys:
   TRIG [SINGLE SWEEP]
   MKR
   PEAK SEARCH

19. Read the average noise as the marker amplitude.

20. Repeat steps 17 through 19 for frequencies of 18500 and 19400.

21. Record the test results in Table 3-4, Displayed Average Noise, and in Table 3-9, Operation Verification Test Record.

19.1 to 22 GHz <-87 dBm

22. Repeat steps 17 through 19 for frequencies of 19.1 and 22 GHz in Band 4.

23. Record the test results in Table 3-4, Displayed Average Noise, and in Table 3-9, Operation Verification Test Record.

Frequency Span Readout Accuracy

This test measures the analyzer's ability to accurately read the frequency of two signals at the same time.

The analyzer's internal 100 MHz comb generator is used to test the wide spans (100 MHz to 2000 MHz). A signal generator is modulated with a synthesizer to generate comb signals for testing the narrow spans (50 kHz to 1 MHz).

Recommended Equipment

AM/FM Signal Generator ........................................... HP 8640B
Frequency Synthesizer .............................................. HP 3335A
BNC cable (2 required). ............................................... HP Part Number 8120-1839
Adapter, Type N (m) to BNC (f). ............................... HP Part Number 1250-0780
SMA cable (1 required). ............................................... HP Part Number 8120-1578
(f → f) 1250-1158 or (m → f) 1250-1200

Test Procedure (100 MHz TO 22 GHz spans)

1. Connect the analyzer 100 MHz Comb Generator to the INPUT 50 Ohm connector of the analyzer.

2. Press the following analyzer keys:
   PRESET (wait until the preset is complete)
   AMPLITUDE
   DOWN ARROW DOWN ARROW
   SPAN 1 0 0 MHz
   If necessary press FREQUENCY and use the RPG to place the comb teeth at the left and right edges of the CRT graticule.

3. Press MKR and turn the RPG to place the marker at the peak of either the left or right comb tooth.

4. Press [MARKER DELTA] and place the second marker at the peak of the other comb tooth.

5. Read the span as the marker delta frequency. Record the span on copies of Table 3-5, Frequency Span Readout Accuracy, and Table 3-9, Operation Verification Test Record. The span should be between the values shown in the tables (98 MHz and 102 MHz).

6. Repeat steps 3 through 5 for the remaining frequency spans (500, 1000, and 2000 MHz).

**NOTE:** It is not necessary to check the frequency span in the other bands as the span dividers are fully checked in Band 0 (50 kHz to 2.9 GHz).
Test Procedure (50 kHz to 1 MHz spans)

1. Connect the equipment as shown in Figure 3-1.

2. Set the HP 8640B Signal Generator for —10 dBm, 10 MHz, and its amplitude modulation input for ac coupling.

3. Set the HP 3335A Frequency Synthesizer to +10 dBm at 100 kHz and adjust the signal generator for 90% amplitude modulation.

4. Press the following analyzer keys:
   
   **PRESET** (wait until the preset is complete)
   **FREQUENCY 1 0 MHz**
   **SPAN 1 MHz**
   **PEAK SEARCH SIGNAL TRACK MKR** [MARKER NORMAL]

   Use the knob to set the marker on the peak of the signal at the left edge of the screen. [MARKER DELTA]

   Use the knob to set the second marker on the peak of the signal at the right edge of the screen.

5. Read the span as the marker delta frequency. Record the span on the copies of Tables 3-5 and 3-9. The span should fall between the values shown on the tables (800 kHz ± 40 kHz).

6. Repeat step 4 for a span of 500 kHz with the frequency synthesizer set to 100 kHz. Record the span (marker reading) (400 kHz ± 20 kHz) on the copies of Tables 3-5 and 3-9.

7. Use the following settings to test the analyzer’s 50- and 100-kHz spans. Record the results.

<table>

Figure 3-1. Test Setup—Frequency Span Readout Accuracy

50-kHz to 1-MHz Spans
Frequency Readout Accuracy

This test verifies the analyzer's ability to measure the frequency of a single CW signal. The test requires a synthesized frequency source that has better frequency accuracy than the analyzer. Note that two different Hewlett-Packard synthesized sources are recommended to cover the specified frequency range of the analyzer.

Specification

\[ \pm (5 \text{ MHz} + 2\% \text{ Span}) \quad 50 \text{ kHz} \text{ to } < 2.75 \text{ GHz} \]
\[ \pm (0.2\% \text{ CF} + 2\% \text{ Span}) \quad 2.75 \text{ to } 22 \text{ GHz} \]

Recommended Equipment

- Frequency Synthesizer: HP 3335A
- Synthesized Sweeper: HP 8340A
- BNC cable: HP Part Number 8120-1839
- SMA cable: HP Part Number 8120-1578

Output adapters for HP 8340:
- SMA(f) to SMA(f): HP Part Number 1250-1158
- SMA(m) to BNC(f): HP Part Number 1250-1200

Test Procedure

1. Connect the 50Ω OUTPUT of the HP 3335A Frequency Synthesizer to the RF INPUT of the analyzer with a BNC cable.

2. Set the frequency synthesizer output to 1 MHz and —20 dBm with no modulation.

3. Press the following analyzer keys:
   - \textit{PRESET} (wait until the preset is complete)
   - \textit{SPAN 2 0 MHz}
   - \textit{FREQUENCY 1 MHz}
   - \textit{PEAK SEARCH [NEXT PEAK RIGHT]}
   - \textit{SIGNAL TRACK}
   - \textit{SPAN 1 0 MHz}

4. Record the analyzer's frequency reading in Table 3-7, Frequency Readout Accuracy Test Results, and in Table 3-9, Operation Verification Test Record.

5. Repeat steps 2, 3, and 4 for the frequencies shown in Table 3-7, Frequency Readout Accuracy; use an HP 8340A/B Synthesized Sweeper instead of the HP 3335A Frequency Synthesizer for the frequencies above 4 MHz.
6. Frequency readout accuracy in harmonic bands is checked at frequencies shown in Table 3-6.

Table 3-7. Frequency Readout Accuracy
Frequency Response Flatness

This test measures the analyzer's ability to accurately compare the amplitudes of two signals of equal amplitude but different frequency (e.g., a two-tone intermodulation measurement). This ability, called flatness, affects the analyzer's ability to accurately compare the amplitudes of two signals of unequal amplitude (e.g., carriers and sidebands).

A synthesized sweeper is used for this test because its flatness is relatively better than the analyzer's. The sweeper tunes a signal through the band of the analyzer while the analyzer is in [MAX HOLD A]. This procedure traces the flatness of the analyzer on the analyzer's screen. Two different synthesized sweepers are used to cover the entire frequency range of the analyzer.

Specification (with 10-dB Attenuation and preselector peaked). Referenced to Calibrator at —20-dB and 299.9 MHz; (includes bandswitching uncertainty).

</table>

Recommended Equipment

- Frequency Synthesizer: HP 3335A
- Synthesized Sweeper: HP 8340A
- Power Meter: HP 436A
- Power Sensor: HP 8485A
- Power Splitter: HP 11667B
- SMA Cable (3 required): HP 8120-1578
- BNC Cable: HP 8120-1839

Adapters for 8592A
- Type N(m) to APC 3.5 (f): HP 1250-1744
- Type N(m) to BNC(f): HP 1250-0780

Test Procedure (50 kHz to 10 MHz)

1. Press the following keys on the analyzer:
   - **Preset** (wait until the preset is complete)
   - [START FREQ] 0 kHz
   - [STOP FREQ] 10 MHz
   - **Amplitude** 0 dBm

2. Set the HP 3335A Frequency Synthesizer to a CW output of 6.0 MHz at 0 dBm. Connect the equipment as shown in Figure 3-2 (a).
3. Tune the frequency synthesizer to place the signal at the center of the analyzer's screen. Set the sweep width of the frequency synthesizer to 11.95 MHz.

4. Press [LOG dB/DIV] 1 +dBm on the analyzer. Adjust the output power of the frequency synthesizer to place the signal at two divisions below reference level line.

5. Press GO TO START FREQ on the frequency synthesizer. Press FREQUENCY and turn the RPG to position the signal at the left edge of the CRT graticule. Then press TRACE A [MAX HOLD A] on the analyzer.

6. Start a 50-second single sweep in the frequency synthesizer. Repeat 50 second sweep three times to get smooth trace. At the end of the third sweep, press [VIEW A] on the analyzer.

7. The frequency response flatness is the maximum peak-to-peak trace variation on the spectrum analyzer's screen. This variation should be less than 2.0 dB. Record the results on a copy of the test record.

Test Procedure (10 MHz to 2.9 GHz)

1. Press the following keys on the analyzer:
   PRESET (wait until the preset is complete)
   FREQUENCY
   [START FREQ] 1 0 MHz
   [STOP FREQ] 2 9 0 0 MHz
   AMPLITUDE 0 +dBm
   [LOG dB/DIV] 1 dB

2. Set the HP 8340A Synthesized Sweeper to CW 300 MHz, then set the power level to +3 dBm.

3. Calibrate the power meter using HP 8485A power sensor.

4. Connect the recommended equipment as shown in Figure 3-2.

5. Adjust the output power of the synthesized sweeper to position the 300 MHz signal two divisions down from the analyzer's reference level. After setting the synthesized-sweeper to CW frequency and setting power level, place power meter in the RANGE HOLD mode.

6. On the analyzer, press TRACE A and [MAX HOLD A].

7. Set the synthesized sweeper's start frequency to 10 MHz and the stop frequency to 2900 MHz. Set synthesized sweeper sweep time to 200 seconds.

8. On the synthesized sweeper, press TRIG [SINGLE SWEEP] to start and complete one sweep. Repeat until three sweeps have been made on the analyzer.

10. Press **MKR** and [MARKER NORMAL]. Adjust the tuning knob to place the marker on the 299.9 MHz calibration peak.

11. Press [MARKER DELTA] and adjust the tuning knob to place the marker at the lowest point on the trace.

12. Read the amplitude difference (direct readout displayed in both the active function block and marker readout areas of the screen).

13. Adjust the tuning knob to place the marker at the highest point on the trace.

14. Read the displayed amplitude difference.

15. The frequency response flatness is the maximum peak to peak trace variation on the spectrum analyzer's screen. This variation should be less than ±2.0 dB, referenced to the 299.9 MHz CAL signal.

16. Record the test results on copies of Table 3-8 Frequency Response Flatness, and Table 3-9, Operation Verification Test Record.

### 2.75 GHz to 22 GHz

17. Press **FREQUENCY** [HRM LOCK] [2.75-6.2 BAND 1].

18. Set synthesized sweeper to START FREQUENCY of 3.0 GHz and STOP FREQUENCY of 6.0 GHz.

19. Verify that the to HP 8485A power sensor is now in use.

20. Calibrate power meter and zero sensor; set CAL FACTOR on the power meter to sensor value at the center of the frequency band, i.e., 4 GHz value.

21. Connect HP 8485A to output of 11667B power splitter.

22. Press CW on the synthesized sweeper and set frequency to 3.5 GHz. Press analyzer **AMPLITUDE** and set reference level for —0 dBm. Adjust synthesized-sweeper output power to position signal two divisions down from analyzer reference level.

23. On the analyzer press **AMPLITUDE** [PRESEL PEAK]. When preselection routine is complete, press **MKR** [MARKERS OFF] **TRACE A** [CLEAR/WRITE A] [MAX HOLD A].

24. On the synthesized sweeper press single sweep to start and complete one sweep. Repeat until three sweeps have been made on the analyzer.

26. Press **MKR** and [MARKER NORMAL]. Adjust the tuning knob to place the marker on the trace maximum.
27. Press [MARKER DELTA] and adjust the tuning knob to place the marker at the lowest point on the trace.

28. Read the amplitude difference (direct readout displayed in both the active function block and marker readout areas of the screen).

29. The frequency response flatness is the maximum peak to peak trace variation on the spectrum analyzer's screen. This variation should be within the values shown in Table 3-8.

30. Record the test results on copies of Table 3-8, Frequency Response Flatness, and Table 3-9, Operation Verification Test Record.

31. For the remaining harmonic bands, i.e., 6.0-12.8 GHz, 12.4-19.4 GHz and 19.1-22 GHz, repeat steps 17 through 30. Set the START and STOP frequencies of the synthesized-sweeper and the analyzer to the harmonic band limits. Set the CW frequency to mid-band and press [PRESEL PEAK].

32. For harmonic band 4, 19.1-22 GHz, set the CRT scale to 2 dB/Division Log, i.e., press AMPLITUDE [LOG dB/DIV] 2 dB. Readjust the power output of the synthesized-sweeper to position signal two divisions down from CRT reference level.

CHAPTER 4

IF SOMETHING GOES WRONG

What You'll Find in This Chapter

Your Spectrum Analyzer is built to provide dependable service. It is unlikely that you will experience a problem with the analyzer. However, if you do, or if you desire additional information or wish to order parts, options, or accessories, HP's worldwide sales and service organization is ready to provide the support you need.

In general, a problem can be caused by a hardware failure, a software error, or a user error. Follow these general steps to determine the cause and to resolve the problem:

- perform the quick checks listed in the following "Check the Basics" section; these checks may eliminate the problem altogether, or may give a clearer idea of its cause
- if the problem is a hardware problem, you have several options:
  - repair it yourself; see the "Service Options" section
  - return the analyzer to HP for repair;
    - if the analyzer is still under warranty or is covered by an HP maintenance contract, it will be repaired under the terms of the warranty or plan (the warranty is printed on the inside front cover of this manual)
    - if the analyzer is no longer under warranty or covered by an HP maintenance plan, HP will notify you of the cost of the repair after examining the unit

Also see the "How to Call HP" and "How to Return Your Analyzer for Service" paragraphs for more information.
Before You Call HP

Check the Basics

A problem often can be solved by rechecking what was being done when the problem occurred. A few minutes spent in performing some simple checks may save waiting for your instrument to be repaired. Before calling HP or returning the spectrum analyzer for service, please make the following checks:

- Is the analyzer plugged in to the proper ac power source? Does the line socket have power?
- Is the rear-panel voltage selector switch set correctly? Is the line fuse good?
- Is the analyzer turned on?
- If other equipment, cables, and connectors are being used with the analyzer, are they connected properly and operating correctly?
- Review the procedure for the test being performed when the problem appeared. Are all the switch settings correct?
- Is the test being performed, and the results that are expected, within the specifications and capabilities of the analyzer? (See Chapter 1, Table 1-1, for analyzer specifications.)
- Is the analyzer displaying an error message? If so, refer to Appendix A.
- Are the analyzer’s measurements obviously inaccurate? If so, the analyzer’s calibration data may have been destroyed. Refer to the Support Manual or contact the nearest Hewlett-Packard Sales and Service Office listed in Table 4-1.

- Perform the frequency and amplitude calibration routines given in the “Turning the Analyzer On for the First Time” paragraph in Chapter 2. After running these routines, perform the Confidence Test that is described in the same paragraph. Record all error messages that appear.

- If the necessary test equipment is available, perform the Operation Verification tests given in Chapter 3. Record all results on an Operation Verification Test Record located at the end of Chapter 3.
Read the Warranty

The warranty for your Spectrum Analyzer is printed on the inside front cover of this manual. Please read it and become familiar with its terms.

If your analyzer is covered by a separate maintenance agreement, please be familiar with its terms.

Service Options

HP offers several optional maintenance plans to service your analyzer after the warranty has expired. Call your HP Sales and Service office for full details.

If you want to service the analyzer yourself after the warranty expires, you can purchase a Service Documentation Package that provides all necessary test and maintenance information. You can order the Service Documentation Package through your HP Sales and Service office. The package is described under “Service Documentation (Option 915)” in Chapter 1 of this manual.

How to Call HP

Hewlett-Packard has Sales and Support offices around the world to provide you with complete support for your analyzer. To obtain servicing information or to order replacement parts, contact the nearest Hewlett-Packard Sales and Service Office listed in Table 4-1. In any correspondence or telephone conversations, refer to the instrument by its model number and full serial number. With this information, the HP representative can quickly determine whether your unit is still within its warranty period.

How to Return Your Analyzer for Service

Service Tag

If you are returning the analyzer to Hewlett-Packard for servicing, fill in and attach a blue service tag. Several service tags are supplied at the rear of this manual. Please be as specific as possible about the nature of the problem. If you have recorded any error messages that appeared on the screen, or have completed a Performance Test Record, or have any other specific data on the performance of the analyzer, please send a copy of this information with the unit.

Original Packaging

Before shipping, pack the unit in the original factory packaging materials if they are available. If the original materials were not retained, identical packaging materials are available through any Hewlett-Packard office. Descriptions of the packaging materials are listed in Chapter 2, “Getting Ready.”
Other Packaging

CAUTION

Analyzer damage can result from using packaging materials other than those specified. Never use styrene pellets in any shape as packaging materials. They do not adequately cushion the equipment or prevent it from shifting in the carton. They cause equipment damage by generating static electricity and by lodging in the analyzer fan.

You can repack the instrument with commercially available materials, as follows:

1. Attach a completed service tag to the instrument.

2. If you have a front-panel cover, install it on the instrument; if not, protect the control panel with cardboard.

3. Wrap the instrument in anti-static plastic to reduce the possibility of damage caused by electrostatic discharge.

4. Use a strong shipping container. A double-walled, corrugated cardboard carton with 159-kg (350-lb) bursting strength is adequate. The carton must be both large enough and strong enough to accommodate the analyzer. Allow at least three to four inches on all sides of the analyzer for packing material.

5. Surround the equipment with three to four inches of packing material and prevent the equipment from moving in the carton. If packing foam is not available, the best alternative is S.D.-240 Air Cap™ from Sealed Air Corporation (Commerce, California, 90001). Air Cap looks like a plastic sheet filled with 1-1/4 inch air bubbles. Use the pink-colored Air Cap to reduce static electricity. Wrapping the equipment several times in this material should both protect the equipment and prevent it from moving in the carton.

6. Seal the shipping container securely with strong nylon adhesive tape.

7. Mark the shipping container “FRAGILE, HANDLE WITH CARE” to assure careful handling.

8. Retain copies of all shipping papers.
Screen Messages

The analyzer can generate various messages that appear on its screen during operation to provide an indication of progress through a procedure or to indicate a problem.

There are three types of messages: hardware error messages (H), user-created error messages (U), and informational messages (M).

- Hardware error messages indicate the analyzer hardware is probably broken.
- User-created error messages appear when the analyzer is used incorrectly. They are usually generated during remote operation.
- Informational messages indicate analyzer progress within a specific procedure.

The messages are listed in alphabetical order on the following pages; each message is defined, and its type is indicated by an (H), (U), or (M). In several instances, you are referred to the command description (for example, "See the AUNIT command"). These command descriptions are contained in the Programming Manual.

ADC-GND FAIL
Indicates a failure in the processor - A/D ±15V supplies can cause ADC-GND and ADC-2V. (H)

ADC-TIME FAIL
Indicates a failure in the processor - A/D A +5V supply can cause this. (H)

ADC-2V FAIL
Indicates a failure in the processor - A/D ±15V supplies can cause ADC-GND and ADC-2V. (H)

CAL: FM SPAN SENS FAIL
The analyzer could not set up span sensitivity of the FM coil. (H)

CAL: LINEAR DET FAIL
The linear calibration routine failed. (H)

CAL: RES BW AMPL FAIL
The relative insertion loss of the resolution bandwidth is incorrect. (H)

CAL: SPAN SENS FAIL
The calibration span sensitivity routine failed. (H)

CAL:
During the calibration routine, messages may appear on the display indicating the routine is progressing: MC DELAY, FM DELAY, DONE, SWEEP, SWP DELAY, FREQ, SPAN, AMPTD, 3dB BW, ATTEN, Log AMP, PEAKING, YTF. (M)
COMMAND ERROR:
The specified command is not recognized by the analyzer. The analyzer will recognize the commands described in Chapter 4 of the Programming Manual. (U)

CONFLICT TABLE OVERFLOW
A command has been used that is not compatible with the analyzer. (U)

FAIL: _ _ _
An error was discovered during the power-up check. The 4-digit by 8-digit code indicates the type of error. Error codes are described in the Support Manual. (H)

INVALID AUNITS:
The amplitude units are not valid. See the AUNITS command. (U)

INVALID DETECTOR:
The specified detector is not valid. See the DET command. (U)

INVALID ENTER FORMAT
The enter format is not valid. See the appropriate command description to determine the correct format. (U)

INVALID HP-IB ADDRESS OR OPERATION
An HP-IB operation was aborted due to an incorrect address or invalid operation. (U)

INVALID HP-IB OPERATION REM TRUE
The HP-IB operation is not allowed. (Usually caused by print/plot when a calculator is on the interface bus.) (U)

INVALID HP-IL ADDRESS OR OPERATION
An HP-IL operation was aborted due to an incorrect address or invalid operation. (U)

INVALID HP-IL OPERATION REM TRUE
The HP-IL operation is not allowed. (Usually caused by print/plot when a calculator is on the interface bus.) (U)

INVALID OUTPUT FORMAT
The output format is not valid. See the appropriate command description to determine the correct format. (U)

INVALID RS-232 ADDRESS OR OPERATION
An RS-232 operation was aborted due to an incorrect address or invalid operation. (U)

INVALID TRACE:
The specified trace is invalid. See trace commands (VIEW, MXMH, CLRW or BLANK). (U)

INVALID TRIGGER MODE:
The specified trigger mode is invalid. See the TM command. (U)
INVALID WINDOW TYPE:
The specified window is invalid. See the TWNDOW command. (U)

MEAS UNCAL
The measurement is uncalibrated. Check the sweep time, span, and bandwidth settings. (U)

PARAMETER ERROR:
The specified parameter is not recognized by the analyzer. See the appropriate command description to determine the correct parameters. (U)

SRQ
The specified service request is active. Service requests are a form of informational message and are explained in Appendix B of the Installation Manual. (M)
APPENDIX B

Service Requests

This appendix describes the analyzer service request (SRQ) capability. A service request is an analyzer output that tells the operator or computer that a specific event has taken place in the analyzer.

When writing programs, service requests can be used to interrupt the computer program sequence, causing the program to branch to a subroutine. For example, by using service requests, the computer can perform other operations while the analyzer is sweeping. When the sweep is completed, the computer can service the analyzer by changing the analyzer state or reading data from the display memory.

Note: Service requests do not work with computers that have only an RS-232 interface. HP-IB and HP-IL computers do not all have the same service request capabilities. Refer to the manuals supplied by your computer's manufacturer.

When making a service request, the analyzer places the I/O interface SRQ line true and the analyzer CRT display reads out SRQ with a number. Setting the SRQ line true announces to the computer that the analyzer requires attention. The computer can then command the analyzer to send its "status byte." The status byte indicates the type of service request.

Note: If the CRT display annotation has been blanked, the service request notation will not appear.

Note: A serial polling technique must be used by the computer to test for service requests. The analyzer does not respond to parallel polling.
Status Byte Definition

The status byte sent by the analyzer determines the nature of the service request. The meaning of each bit of the status byte is explained in Table B-1.

Table B-1. Status Byte Definition

<table>
<thead>
<tr>
<th>Bit (LSB)</th>
<th>Message</th>
<th>CRT Display Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Unused</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Unit Key</td>
<td>SRQ 102</td>
</tr>
<tr>
<td>2</td>
<td>End of sweep</td>
<td>SRQ 104</td>
</tr>
<tr>
<td>3</td>
<td>Hardware broken</td>
<td>SRQ 110</td>
</tr>
<tr>
<td>4</td>
<td>Command complete</td>
<td>SRQ 120</td>
</tr>
<tr>
<td>5</td>
<td>Illegal analyzer command</td>
<td>SRQ 140</td>
</tr>
<tr>
<td>6</td>
<td>Universal HP-IB service request</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>HP-IB RQS bit</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Unused</td>
<td></td>
</tr>
</tbody>
</table>

The CRT display message is an octal number based on the binary value of the status byte. This octal number always begins with a "1" since this is translated from bit 6, the universal service request bit. The status byte for an illegal analyzer command (SRQ 140) is as follows:

<table>
<thead>
<tr>
<th>bit number</th>
<th>7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>status byte</td>
<td>0 1 1 0 0 0 0 0</td>
</tr>
</tbody>
</table>

The CRT displays the octal equivalent of the status byte binary number:

SRQ 140

The octal equivalent is based on the whole binary number:

01100000 (binary) = 140 (octal)

One simple way to determine the octal equivalent of the binary number is to partition the binary number three bits at a time from the least significant bit, and treat each part as a single binary number:

<table>
<thead>
<tr>
<th>binary</th>
<th>0 1 1 0 0 0 0 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>octal</td>
<td>1 4 0</td>
</tr>
</tbody>
</table>
The decimal equivalent of the octal number is determined as follows:

\[ 140 \text{ (octal)} = 1 \times (8) + 4 \times (8) + 0 \times (8) = 96 \text{ (decimal)} \]

More than one service request can be sent at the same time. For example, if an illegal analyzer command (SRQ 140) and the end of a sweep (SRQ 104) occurred at the same time, SRQ 144 appears on the CRT display, because both bit 5 and bit 2 are set as shown below:

<table>
<thead>
<tr>
<th>bit number</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>status byte</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>octal value</td>
<td>1</td>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>4</td>
</tr>
</tbody>
</table>

= "SRQ 144"

**Service Request Activating Commands**

With the exceptions of SRQ 140 and SRQ 102, service requests can only be activated from a computer. (SRQ 140 and SRQ 102 are always activated.) Your Programming Manual describes service request activating commands in Chapter 4 under RQS and SRQ.
