**Instrument Serial Numbers**

Each instrument manufactured by Tektronix has a serial number on a panel insert or tag, or stamped on the chassis. The first letter in the serial number designates the country of manufacture. The last five digits of the serial number are assigned sequentially and are unique to each instrument. Those manufactured in the United States have six unique digits. The country of manufacture is identified as follows:

- B010000 Tektronix, Inc., Beaverton, Oregon, USA
- E200000 Tektronix United Kingdom, Ltd., London
- J300000 Sony/Tektronix, Japan
- H700000 Tektronix Holland, NV, Heerenvoor, The Netherlands

Instruments manufactured for Tektronix by external vendors outside the United States are assigned a two digit alpha code to identify the country of manufacture (e.g., JP for Japan, HK for Hong Kong, IL for Israel, etc.).

Tektronix, Inc., P.O. Box 500, Beaverton, OR 97077

Printed in U.S.A.

Copyright © Tektronix, Inc., 1989, 1993. All rights reserved. Tektronix products are covered by U.S. and foreign patents, issued and pending. The following are registered trademarks: TEKTRONIX, TEK, TEKPROBE, and SCOPE-MOBILE.
WARRANTY

Tektronix warrants that this product will be free from defects in materials and workmanship for a period of three (3) years from the date of shipment. If any such product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, with shipping charges prepaid. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; or c) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

This warranty is given by Tektronix with respect to this product in lieu of any other warranties, expressed or implied. Tektronix and its vendors disclaim any implied warranties of merchantability of fitness for a particular purpose. Tektronix' responsibility to repair or replace defective products is the sole and exclusive remedy provided to the customer for breach of this warranty. Tektronix and its vendors will not be liable for any indirect, special, incidental, or consequential damages irrespective of whether Tektronix or the vendor has advance notice of the possibility of such damages.
This apparatus has been designed and tested in accordance with IEC Publication 348, Safety Requirements for Electronic Measuring Apparatus, and has been supplied in a safe condition. This manual contains some information and warnings which have to be followed by the user to ensure safe operation and to retain the apparatus in safe condition.

The apparatus has been designed for indoor use. It may occasionally be subjected to temperatures between +5°C and -10°C without degradation of its safety.
Welcome

This manual is designed to familiarize you with the features and operation of the 2221A Digital Storage Oscilloscope.

The Before You Begin section contains important safety information as well as instructions on preparing the instrument for use.

Use the At a Glance section to learn about each of the front-panel controls and menus.

With the in Detail section you can begin exploring the various ways of using the oscilloscope to display, measure, and store waveforms.

Related Manuals

Tektronix also provides the following documentation for the 2221A Digital Storage Oscilloscope:

- The 2221A Service Manual contains extended service information, including circuit description, schematics, and a complete electrical parts list. There are two service manuals: part number 070-8157-01 documents instruments with serial numbers B01000 to B019999; and part number 070-8549-XX is for serial numbers B020000 and above.

- The 2221A, 2224, & 2232 Optional GPIB & RS-232-C Interfaces User Manual (070-8159-XX) shows how to connect, program, and use the optional GPIB and RS-232-C communication interfaces.

- The QuickStart package (020-1812-04 for the U.S. and 020-1812-06 for international) includes a video tape and exercises along with a signal board to provide you with practical instruction.

Your Tektronix 2221A Digital Storage Oscilloscope is a superb tool for displaying, measuring and saving waveforms. Its performance addresses the needs of both benchtop lab and portable applications:

- Combination analog and digital oscilloscope
- 100 MHz maximum analog bandwidth
- 100 Megasamples/sec digital sampling rate
- Multiple storage acquisition modes including glitch capture as narrow as 10 ns
- Cursor measurement and digital readouts
- Waveform storage and retrieval
- XY Plotter output
- Optional RS-232 or GPIB communication interfaces
Safety

Please take a moment to review these safety precautions. They are provided for your protection and to prevent damage to the oscilloscope. This safety information applies to all operators.

Symbols and Terms

These two terms appear in manuals:

- **CAUTION** statements identify conditions or practices that could result in damage to the equipment or other property.

- **WARNING** statements identify conditions or practices that could result in personal injury or loss of life.

These two terms appear on equipment:

- **CAUTION** indicates a personal injury hazard not immediately accessible as one reads the marking, or a hazard to property including the equipment itself.

- **DANGER** indicates a personal injury hazard immediately accessible as one reads the marking.

This symbol appears in manuals:

![Static-Sensitive Devices](image)

These symbols appear on equipment:

- ![DANGER](image)
  High Voltage

- ![Protective ground (earth) terminal](image)

- ![ATTENTION](image)
  Refer to manual
Specific Precautions

Observe all the following precautions to ensure your personal safety and to prevent damage to either the 2221A or equipment connected to it.

Power Source

The 2221A is intended to operate from a power source that will not apply more than 250 Vrms between the supply conductors or between either supply conductor and ground. A protective ground connection, through the grounding conductor in the power cord, is essential for safe system operation.

Grounding the Oscilloscope

The 2221A oscilloscope is grounded through the power cord. To avoid electric shock or possible damage to instrument, plug the power cord into a properly wired receptacle where earth ground has been verified by a qualified service person. Do this before making connections to the input or output terminals of the oscilloscope.

Without the protective ground connection, all parts of the 2221A are potential shock hazards. This includes knobs and controls that may appear to be insulators.

Use the Proper Power Cord

Use only the power cord specified for your product. Use only a power cord that is in good condition.

Use the Proper Fuse

To avoid fire hazard, use only the fuse specified in the parts list for your product, and which is identical in type, voltage rating, and current rating.

Do Not Remove Covers or Panels

To avoid personal injury, do not operate the 2221A without the panels or covers.

Do Not Operate in Explosive Atmospheres

The 2221A provides no explosion protection from static discharges or arcing components. Do not operate the 2221A in an atmosphere of explosive gasses.

Electric Overload

Never apply a voltage to a connection on the 2221A that is outside the range specified for that connection. Do not attempt to operate the oscilloscope without a proper ground connection.
Before you use the 2221A Digital Storage Oscilloscope, ensure that it is properly installed and powered on.

**Installation & Power On**

To install and power on the 2221A Digital Storage Oscilloscope, perform the following steps:

- **Step 1:** Connect the proper power cord to the back of the instrument as shown below in Figure 1-1.

  ![Power Cord Installation](image)

  **Figure 1-1: Installing the Power Cord**

- **Step 2:** Check that you have the proper power supply for the instrument. The 2221A requires a line source that is 90 to 250 VAC with a frequency of 48 Hz to 440 Hz.
Step 3: Check the fuse to be sure it is the proper type and rating. The 2221A is shipped with the UL® approved fuse installed.

Step 4: Be sure you have the appropriate operating environment. Specifications for temperature, relative humidity, altitude, vibrations, and emissions are included in the Specifications appendix of this manual.

Step 5: Leave space for cooling. Do this by verifying that there are no airflow obstructions within 2 inches (5.1 cm) of the air-intake on the sides of the cabinet and exhaust holes on the rear of the cabinet (where the fan operates).

Step 6: Connect the power cord from the rear-panel power connector to the power system.

Step 7: Push the POWER button in to turn on the instrument. A green light indicates the power is on.

The instrument automatically runs a complete diagnostic check of the digital system. If any diagnostic failures occur they will appear on screen. Contact your service representative if you encounter a problem.

Pressing the POWER button again toggles the switch and turns off the power.

---

Initial Setup

This section will help you set up the oscilloscope for use and allow you to become familiar with some of the controls.

Setting Up the Display

Table 1-1 gives a setup for a basic analog display. Use the setup for the trace rotation and probe compensation adjustments that follow.

Adjusting Trace Rotation

Using the previous setup, Figure 1-2 shows how the display should now appear.

![Figure 1-2: Initial Setup Display](image)

Use the following procedure to align the baseline trace parallel with the center horizontal graticule line:

- **Step 1:** Turn the Channel 1 POSITION control to position the trace on the center horizontal graticule line.

- **Step 2:** Using a small-blade screwdriver, adjust the recessed TRACE ROTATION control to align the trace with the graticule line.

You may need to make this adjustment again if you move or orient the oscilloscope in a different direction.
Checking the Probe Compensation

NOTE

Always compensate a probe for the particular channel that you use it with.

Use the following procedure to check the probe compensation:

☐ Step 1: Set the instrument controls as described in Setting up the Display.

☐ Step 2: Connect the probe to the channel you intend to use it for.

(If the probe is properly "coded" the volts-per-division readout for the channel will change to match the attenuation factor of the probe. The 10X probes supplied with the oscilloscope already have the proper coding.)

☐ Step 3: Clip the probe tip to the PRB ADJ connector.

☐ Step 4: Use the VOLTS/DIV control to display about 5 divisions of the waveform.

☐ Step 5: Use the VERTICAL POSITION and HORIZONTAL POSITION controls to center the display.

☐ Step 6: Check the waveform against Figure 1-3 to see if the probe is correctly compensated.

![Over compensated](image)

![Under compensated](image)

![Correctly compensated](image)

Figure 1-3: Checking Probe Compensation

☐ Step 7: Adjust the compensation if necessary.
NOTE

The instruction manual supplied with the probe provides complete information about the probe and probe compensation.

Installing the Accessory Pouch

Figure 1-4 shows the correct method of installing the accessory pouch on the instrument.

A. Center the Pouch Plate to Align the Key Slots.

B. Push the Pouch Plate into the Rear Trim Gap.

C. Bow the Plate and Slide it into the Front Trim Gap.

Figure 1-4: Installing the Accessory Pouch
Using the Power Cord Wrap

Figure 1-5 shows how to wrap the power cord on the back when you transport or store the instrument.

Figure 1-5: Using the Power Cord Wrap
The controls and other features on the front panel of the 2232 Digital Storage Oscilloscope are divided into functional sections. Each functional section is highlighted in (Figure 2-1):

**Figure 2-1: Front Panel Control Sections**

Figures 2-2 and 2-3 show the front panel of the oscilloscope in greater detail.
Figure 2-2: Front Panel View — Left Side
Figure 2-3: Front Panel View — Right Side
Power Switch

The power switch is shown in Figure 2-4.

Figure 2-4: Power Switch

POWER

The push-button switch turns the power on and off. A green light indicates the power is on.
CRT Display

The CRT graticule area (Figure 2-5) is divided into eight vertical divisions for amplitude (volts/division) measurements and ten horizontal divisions for time (seconds/division) measurements. The settings of the volts/division and seconds/division controls determine the scale of the graticule.

Figure 2-5: CRT Graticule

Each major division is split into 5 minor divisions. One minor division equals two-tenths (.2) of a major division.
Display Mode

There are two separate display modes: the analog **NON-STORE** mode (Figure 2-6) and the digital **STORE** mode (Figure 2-7). The **STORE/NON-STORE** button selects the display mode.

![Display Mode Diagram]

**Figure 2-6: Analog (NON-STORE) Mode Display**
Other Readout Symbols

> Indicates uncalibrated volts/division or seconds/division switch settings.

\( \downarrow \) Appears before the Channel 2 volts/division readout when INVERT is on.

\( ^{\text{8}} \) Appears next to the volts/division readouts when the BW LIMIT switch is on.

\( ^{\text{~}} \) Appears above the volts/division readout volts symbol (V) if input coupling is set to AC. Also appears above the Trigger Level volts symbol when the COUPL switch is set to LF REJ or when input coupling is set to AC.

\( ^{\text{\Perp}} \) Precedes the volts/division readout if the input coupling is set to GND. Replaces the \( \Delta \) symbol in the \( \Delta \) volts readout when making ground-referenced voltage measurements.

\( ^{\text{c}} \) Indicates a compressed 4K record.

\( ^{\text{%}} \) Replaces the volts symbol (V) whenever the volts/division variable (CAL) is in the uncalibrated position.

\( ^{\text{—}} \) Appears on the top graticule line below the SRQ, ADDR or PLOT markings to indicate the status of the communications option (GPIB or RS-232). A similar symbol under the SREF readouts 1, 2, 3, 4K (reference memories) or A (current acquisition) indicates which of these waveform displays is currently selected for cursor measurement.
CRT Display Controls

The CRT display controls (Figure 2-8) adjust the alignment, intensity and focus of the waveform displays and readout information.

Figure 2-8: CRT Display Controls
1. **INTENSITY**
   Adjusts the intensity of the **NON-STORE** sweep.

2. **TRACE ROTATION**
   Aligns baseline trace with the horizontal graticule. (Use a small screwdriver to adjust the recessed control.)

3. **INTENSITY STORE/READOUT**
   Adjusts the intensity of the entire **STORE** display as well as **NON-STORE** readouts.

4. **GRATICULE**
   Controls graticule illumination.

5. **FOCUS**
   Focuses the display.

6. **BEAM FIND**
   Locates dim or off-screen displays.
Vertical Controls and Connections

Figures 2-9 and 2-10 show the vertical controls and connections.

Figure 2-9: Vertical Controls and Connections
1. **POSITION (Channel 1)**
   Vertically positions the signal displayed in Channel 1.

2. **X-Y**
   Displays simultaneous phase and amplitude relationships between signals connected to Channel 1 and Channel 2 (Lissajous figures). The signal in Channel 1 drives the horizontal (X) axis and the signal in Channel 2 drives the vertical (Y) axis.

3. **BW LIMIT**
   (Bandwidth Limit) — Reduces or eliminates unwanted high-frequency noise on the input signal by limiting the bandwidth of the oscilloscope to 20 MHz.

4. **POSITION (Channel 2)**
   Vertically positions the signal displayed in Channel 2.

5. **ADD ALT CHOP**
   (This switch is activated when the CH 1 BOTH CH 2 switch is in BOTH.)
   *ADD* — Displays the sum of Channel 1 and Channel 2 signals. (Displays the difference between Channel 1 and Channel 2 with Channel 2 INVERT pushed in.)
   *ALT* (Alternate) — Alternates the sweep between Channel 1 and Channel 2 display.
   *CHOP* — Electronically switches the sweep display between Channel 1 and Channel 2 at a rate of 500 kHz.

6. **INVERT**
   Vertically inverts the Channel 2 signal.

7. **VOLTS/DIV (Channel 2)**
   (Volts per division) — Selects the vertical scale factor for Channel 2. Also vertically expands or compresses Channel 2 saved waveforms.

8. **CAL (Channel 2)**
   (Calibrated) — The clockwise position provides calibrated volts/division settings. Rotating the control counterclockwise variably increases the attenuation of the settings, thereby reducing signal amplitude. (Variable settings are not calibrated.)
Figure 2-10: Vertical Controls and Connections (Cont.)
9. COUPLING (Channel 2)
   AC — Capacitively couples the signal input. Blocks DC to 10 Hz signals.
   GND (Ground) — Decouples the signal input and connects the vertical system to ground reference.
   DC — Passes all signal components to the vertical and acquisition systems.

10. Input Connection (Channel 2)
    Provides the Channel 2 signal input connection for probes or coaxial cables.

11. GND Connection
    The “Banana” jack receptacle provides a connection to the instrument ground.

12. Input Connection (Channel 1)
    Provides the Channel 1 signal input connection for probes or coaxial cables.

13. COUPLING (Channel 1)
    AC — Capacitively couples the signal input. Blocks DC to 10 Hz signals.
    GND (Ground) — Decouples the signal input and connects the vertical system to ground reference.
    DC — Passes all signal components to the vertical and acquisition systems.

14. VOLTS/DIV (Channel 1)
    (Volts per division) — Selects the vertical scale factor for Channel 1. Also vertically expands or compresses Channel 1 saved waveforms.

15. CAL (Channel 1)
    (Calibrated) — The clockwise position provides calibrated volts/division settings. Rotating the control counterclockwise variably increases the attenuation of the settings, thereby reducing signal amplitude. (Variable settings are not calibrated.)

16. CH 1 BOTH CH 2
    Selects either a single-channel display or a two-channel display:
    CH 1 — Displays Channel 1 only.
    BOTH — Activates the ADD ALT CHOP switch for two-channel displays.
    CH 2 — Displays Channel 2 only.

17. PRB ADJ
    (Probe Adjust) — Provides a 0.5 V square wave signal to compensate X10 probes.
Horizontal Controls

The horizontal controls are shown in Figure 2-11.

Figure 2-11: Horizontal Controls
1. **POSITION**
   Horizontally positions signal displays in both **STORE** and **NON-STORE** modes.

2. **SEC/DIV**
   Selects the horizontal seconds-per-division scale for the sweep.

3. **X10 PULL**
   In **NON-STORE**, pulling the knob out horizontally magnifies (by ten times) the center one division of the display.
   In **STORE**, pulling the knob out horizontally magnifies (by ten times) one division area of the display centered around the active cursor.

4. **CAL**
   In **NON-STORE**, rotating the control counterclockwise variably decreases the sweep speed. The clockwise position selects calibrated settings.
   In **STORE**, rotating the control counterclockwise horizontally compresses 4K acquisitions to 1K.

4. **X10 (STORE ONLY)**
   Slows the **STORE** sweep speeds of 0.1, 0.2, and 0.5 seconds to 1, 2, and 5 seconds respectively.
Trigger Controls

Figure 2-12 and Figure 2-13 illustrate the trigger controls.
1. **VAR HOLDOFF**
   (Variable Holdoff) — Variates the amount of time the horizontal system waits before beginning another sweep. This helps stabilize the display of some waveforms.

   The holdoff time in the **MAX** position is at least 10 times greater than **NORM**.

2. **P-P AUTO/TV LINE**
   Automatically determines the trigger level on repetitive signals of 20 Hz and higher in **NON-STORE** and 500 Hz and higher in **STORE**. Initiates a baseline reference trace in the absence of an adequate trigger signal.

   If a TV signal is applied, the oscilloscope will trigger on the TV line information.

3. **NORM**
   (Normal Triggering Mode) — In **NON-STORE**, the **TRIGGER LEVEL** control sets the trigger point regardless of the trigger signal amplitude. The oscilloscope does not automatically sweep without an adequate trigger signal. This mode is useful for low frequency or low repetition rate signals.

   In **STORE**, the last signal acquired is displayed until the next trigger occurs.

   **TV FIELD** — (Press **P-P AUTO** and **NORM** in at the same time.) This mode sets the oscilloscope to trigger on television field (vertical sync) signals. The A sweep will occur automatically in the absence of a trigger signal.

4. **EXT COUPL**
   Selects the method of coupling the **EXT INPUT** signal:
   - **AC** — Capacitively couples (and blocks DC components) of the signal.
   - **DC** — Couples DC and all other signal components.
   - **DC/10** — Couples all signal components and attenuates the external input signal by a factor of 10.

5. **EXT INPUT**
   Input connection for an external trigger signal.
Trigger Controls
(Cont.)

Figure 2-13: Trigger Controls (Cont.)
6. COUPL
Selects the method of coupling the trigger source:

**NORM** (Normal Coupling) — Coupies all frequency components of the trigger signal.

**HF REJ** (High-frequency Reject) — Attenuates AC components of the trigger signal above 40 kHz.

**LF REJ** (Low-frequency Reject) — Attenuates AC components of the trigger signal below 40 kHz.

**LINE SOURCE** — Uses a signal derived from the AC power line to trigger the sweep.

7. SOURCE
Selects the trigger signal source:

**VERT MODE** (Vertical Mode) — The selected vertical mode automatically supplies the trigger signal. In **ADD** or **CHOP**, the trigger source is the algebraic sum of the Channel 1 and Channel 2. In **ALT**, the trigger source alternates between the channels in sync with the display.

**CH 1** — Selects only the signal in channel 1 as the trigger source regardless of the vertical mode selected.

**CH 2** — Selects only the signal in channel 2 as the trigger source.

**EXT** (External) — Uses the signal applied to the **EXT INPUT** connector as the trigger signal.

8. LEVEL
Selects the voltage level on the positive (or negative) signal transition at which the trigger will occur.

9. SLOPE
Selects either the positive (button out) or the negative (button in) signal transition for triggering the next sweep or acquisition.

10. SGL SWP
(Single Sweep) — Sets the oscilloscope to trigger a single sweep in the **NON-STORE** mode. In the **STORE** mode, single-shot events are captured and displayed.
Cursor Controls

The cursor controls are shown in Figure 2-14.

![Cursor Controls Diagram]

**Figure 2-14: Cursor Controls**

1. **CURSORS**
   Rotating the CURSORS knob moves the selected cursor. The 1K window of a 4K acquisition will move with the selected cursor to view the entire record.

   (The CURSORS control can also make item selections or change item values in the ACQ and REF Setup menus.)

   **SELECT C1/C2 (PUSH)** — Pushing the CURSORS knob selects the cursor to position. The cursor is enclosed by a box when selected.

2. **SELECT WAVEFORM**
   Selects the waveform on which the cursors appear if one or more reference memories are displayed. The "—" symbol under the "SREF" location readout indicates that the cursors are on this particular reference memory display. (The "A" stands for the current acquisition display.)

   ![Waveform Table]

   Underline indicates the cursors are on reference memory "1"
Acquisition Controls

The Acquisition Controls are shown in Figure 2-15.

Figure 2-15: Acquisition Controls

1. **1K/4K**
   Selects an acquisition record length of either 1K (one-thousand bytes, one screen) or 4K (four-thousand bytes, four screens).

2. **MODE**
   Selects the desired acquisition mode directly without using the acquisition menu. (Refer to Digitizing Signals, page 3-8.)

3. **TRIG POS**
   (Trigger Position) — Selects the acquisition record displayed relative to the trigger position (indicated by a "T") on the waveform; pretrigger, midtrigger, or posttrigger.

4. **SAVE/CONT**
   (Save or continue) — SAVE temporarily freezes and displays the current acquisition record.
   CONT (continue) starts another acquisition.
Save Reference Memory Buttons

The Save Reference Memory buttons are shown in Figure 2-16.

Figure 2-16: Save Reference Memory Buttons

SAVE REF 1, 2, 3 or SAVE REF 4K — When waveforms are displayed in the STORE mode, you can use the buttons to save up to three separate displays acquired in the 1K mode (memory locations 1, 2 or 3) or one display acquired in 4K mode (memory location 4K). Refer to Figure 2-17 and Figure 2-18.

To save a waveform display, press the SAVE REF button first and then one of the memory location buttons within five seconds. The waveform display will be saved to that memory location.

To turn the reference memory display on or off press only the numbered menu button.
Figure 2-17: 1K Two-Channel Acquisition, Memory Location 1

Figure 2-18: 4K Two-Channel Acquisition, Memory Location 4K

Indicates SAVE REF Memory location 1.
The "—" underneath indicates the cursors are on this memory display.

Indicates SAVE REF Memory location 4K.
The Setup Menu buttons are shown in Figure 2-19.

![Setup Buttons Diagram]

Figure 2-19: Setup Buttons

Pressing one of the five Setup buttons displays a corresponding menu on the CRT. Pressing the same button again returns to normal operation.

- **ACQ** — Acquisition Menu
- **DISPLAY** — Display Menu
- **REF** — Waveform Reference Menu
- **PLOT** — Plot Menu
- **ADV FUNCT** — Advanced Functions Menu

**Menu Item Select Buttons** — When a Setup menu is displayed, each bezel button (located underneath the displayed menu) moves a “box” to select from the menu items that appear directly above the button.

For example, pressing the **DISPLAY** setup button brings up the Display Menu (Figure 2-20). Pressing the button underneath **ΔT Display** selects either **ΔT** or **1 / ΔT**.
Acquisition Menu

The Acquisition menu (Figure 2-21) allows you to configure the acquisition system to your particular application.

Acq Mode

**Peakdet** (Peak Detect) — Detects spikes or "glitches" in the acquired signals.
Average — Reduces the amount random signal noise displayed by weighted average of signal samples.

Accpeak (Accumulate Peak) — Accumulates signal peaks over multiple acquisitions.

Sample — Samples the signal at 100 Ms/sec (megasamples per second) but, unlike the other acquisition modes, does not do any digital signal processing.

Roll / Scan

Roll — Continuously acquires and displays waveform data. The acquisition appears to “roll” from right to left across the display. (Roll is only available for settings of 0.1 s to 5 s.)

Scan — Updates the acquisition record left to right across the display at the rate set by the seconds/division control. (Scan is only available for settings of 0.1 s to 5 s.)

Ext Clock

(External Clock) — Selects the slow (Roll/Scan) mode or Fast (Record) mode for an external (acquisition) clock signal applied to the auxiliary connector on the left side of the instrument.

Reset Default Acq Modes

(Reset Default Acquisition Modes) — Resets the Acquisition Menu selections to factory default conditions.

Cursor Knob Func

(Cursor Knob Function) — Selects the menu item value to set with the CURSORS control.

Trig POS (Trigger Position) — Sets the number of points acquired prior to the trigger.

Avg Wgt (Average Weight) — Weights the last sample in the Average acquisition mode from 1/1 to 1/256.

Swp Lim (Sweep Limit) — Selects the number of acquisitions to make before halting; 1 to 999,000 or NO LIMIT.
Display Menu

The Display menu allows you to configure cursor time readout, smoothing and vectors (Figure 2-22).

![Display Menu Diagram]

Figure 2-22: Display Menu

$\Delta T$ Display

$\Delta T$ — Display time or period measurement.

$1/\Delta T$ — Display frequency measurement.

Smooth

Uses a digital process to smooth the waveform display, yet retain the glitch-catching capabilities of Peak Detect or Accumulate Peak acquisition modes. (Smooth applies only to the Peak Detect or Accumulate Peak modes.)

Vector

ON — Connects data points together with vector lines in all acquisition modes.

OFF — Displays only the data points in all acquisition modes.

Auto — Displays vector lines at all seconds/division acquisition settings except repetitive store (0.5 µs to 0.05 µs) and X-Y.
Plot Menu

The Plot menu (Figure 2-23) controls the plotting parameters.

![Plot Menu Diagram]

Figure 2-23: Plot Menu

**Plotter Type**

Selects the analog X-Y Plotter or digital plotter output format. The digital output format requires a GPIB or RS-232 option.

- **XY** — Analog X-Y plotter
- **HPGL** — Hewlett-Packard® Graphics Language
- **EPS7** — Epson® low-speed
- **EPS8** — Epson® high-speed double-density
- **TJET** — Hewlett-Packard® ThinkJet®

**Grat**

- **ON** — Plots graticule lines.
- **OFF** — Suppresses graticule lines.

**Auto Plot**

- **ON** — Automatically plots acquisitions. The graticule and readouts are plotted on the first acquisition only. The oscilloscope will wait for each plot to finish before beginning another acquisition.
- **OFF** — Disables Auto Plot.
XY Setup
Generates a pattern for calibrating analog X-Y plotter gain and offset.

Start
Initiates transmission of the waveform display over the X-Y plotter or communications option.

Advanced Functions Menu
The Advanced Functions menu (Figure 2-24) provides access to various other diagnostics and setup functions.

![Advanced Functions Menu Diagram](image)

Figure 2-24: Advanced Functions Menu

Diag Menu
(Diagnostic Menu) — Selects diagnostic tests and calibration aids used to service the instrument. Detailed menu information is contained in the 2221A service manual.

Comm Menu
(Communications Menu) — Sets stop-bit and flow parameters for the RS-232 option.

Factory Reset
Resets the factory default acquisition, processing, and display modes for all sweep speeds.
Save Setup Menu

The Saved Setups Menu (Figure 2-25) allows you to save acquisition and other menu settings as well as select what default or saved settings the oscilloscope will recall when the power is turned on.

![Saved Setups Menu Diagram]

**Figure 2-25: Save Setup Menu**

**Pwr Up State**

(Power Up State) — Selects one of the following settings for the oscilloscope when the power is turned on:

**Default** — The oscilloscope uses the factory default settings at power up.

**Pwr Dwn** (Power Down) — The oscilloscope automatically saves the acquisition and menu settings when the power is turned off. The instrument will return to these settings when the power is turned back on.

**Setup1** — The oscilloscope uses the settings saved under “Setup1” at power up.

**Setup2** — The oscilloscope uses the settings saved under “Setup2” at power up.

**Select Setup**

**Setup1** — Selects “Setup1” to save to, or recall from, memory.

**Setup2** — Selects “Setup2” to save to, or recall from, memory.
Recall Setup
Recalls the indicated Select Setup memory.

Save Setup
Saves the current software-controlled settings to the indicated Select Setup memory.
Displaying Signals

*Displaying Signals* describes the basic tasks involved in using the 2221A Digital Storage Oscilloscope to reveal the waveform characteristics of electrical signals. In particular, *Building a Basic Display*, provides an overview of the control sections and is a good starting point for anyone unfamiliar with oscilloscopes.

Applying Signals to the Vertical Inputs

There are two vertical channels on the oscilloscope. Each channel has an input connection and an input coupling switch (Figure 3-1).

![Diagram of input connections and coupling switch](image)

**Figure 3-1: Input Connection and Coupling Switch**

Connecting Signals

Use either a probe or coaxial cable to connect a signal to a vertical input.

**CAUTION**

*Be careful to observe the maximum input voltage rating* (≤ 400 V<sub>peak</sub>). *Use a high-voltage probe if necessary.*

For AC signals that have a DC level higher than ten times the volts/division setting, use the precharging technique described below.

**Connecting the Standard Probes** — Use the standard accessory 10X probes supplied with the instrument for most circuit-to-input connections. The 10X attenuation factor provides a high input impedance that minimizes
signal loading in the circuitry under test. The connector ends of the accessory 10X probes are coded to change the readout by the appropriate scale factor.

☐ **Step 1:** Gently twist the probe connector clockwise onto the input BNC until it locks.

☐ **Step 2:** Make sure the probe is properly compensated. Refer to *Checking the Probe Compensation*, page 1-6.

☐ **Step 3:** Connect the ground clip on the probe to the ground connection of the circuit. This will reduce signal noise and provide a common ground reference for DC measurements.

**Probe Accessories** — Tektronix also supplies many other types of probes and probe accessories to meet your measurement needs. Your Tektronix representative, local Tektronix Field Office, or Tektronix products catalog can also provide additional information on accessories.

**Coaxial Cables** — Use a coaxial cable to connect a BNC output or other terminated signal source to the oscilloscope input. If necessary, use a termination (usually 50 Ω) on the signal input to match the characteristic impedance and preserve the fidelity of the signal. Tektronix also carries a variety of coaxial cable and cabling accessories for various applications.

**Coupling Signals**
Use the AC-GND-DC switch to select the desired input coupling mode (Figure 3-1).

**AC** — Capacitively couples the input and blocks DC to 10 Hz signals.

**GND** — Decouples the signal from the input and connects the input circuit to ground reference.

**DC** — Passes all signal components (AC and DC) to the vertical system.

**Precharging the Signal Input**
Use the procedure below when coupling AC signals that have a high DC voltage level or when probing between signals that differ greatly in DC levels. This procedure becomes especially useful if the difference in DC level is more than ten times the volts/division switch setting or if the circuit is sensitive to the charging, or discharging, of the internal AC coupling capacitor.

☐ **Step 1:** Set the input coupling switch to **GND** before connecting the probe tip to a signal source.

☐ **Step 2:** Touch the probe tip to the oscilloscope chassis ground (**GND**) connector.

☐ **Step 3:** Wait several seconds for the input-coupling capacitor to discharge.
Step 4: Connect the probe tip to the signal source.

Step 5: Wait several seconds for the input-coupling capacitor to charge to the DC level of the signal source.

Step 6: Set the input coupling switch to AC. Position the AC signal within the graticule area.

Building a Basic Display

Displaying a simple, repetitive signal is one of the most common tasks encountered when using an oscilloscope. To properly display a signal you must make the appropriate control settings in four different sections of the front panel:

- CRT Display
- Vertical
- Horizontal
- Trigger

These control sections are arranged left to right across the front panel of the 2221A Digital Storage Oscilloscope.

Presetting the Controls

It is often helpful to preset the front panel controls to get a sweep on the screen before you try to apply a signal. With a simple "trace" on screen you can adjust the display intensity and focus before you make any other settings.

If you are unfamiliar with oscilloscopes you may want to begin with the basic analog setup given in Start Up, page 1-4. In addition, the following sections describe the basic controls and a general approach to setting them:

- Selecting the Display Mode (STORE/NON-STORE)
- Selecting the Trigger Mode
- Selecting the Horizontal Mode and Scale
- Selecting the Vertical Mode and Scale
- Setting the Display Intensity and Focus
- Finding "Lost" Displays

Selecting the Display Mode (STORE/NON-STORE)

Toggle the STORE/NON-STORE button to display signals in either the digital (STORE) or analog (NON-STORE) mode. You may find it helpful to set up the signal display in the analog mode first before switching to the STORE mode.
As soon as you enter the STORE mode the oscilloscope digitally acquires the signal and actively displays it on the screen. Acquisition modes for different sweep speeds are determined by default but they may be changed. (Refer to Digitizing Signals, page 3-8.) The front panel controls that govern the analog display in NON-STORE also govern the storage display. The STORE mode, however, gives you the additional capabilities of digital processing, cursor measurements, and waveform storage and retrieval.

Selecting the Trigger Mode

Set the trigger mode to P-P AUTO for most routine displays. This mode automatically adjusts the range of the trigger-level control for repetitive signals above 20 Hz and automatically generates a sweep in the absence of an adequate trigger signal.

There are many other ways to trigger a signal. Refer to the section entitled Triggering on Signals, page 3-25, for a complete discussion.

Selecting the Horizontal Mode and Scale

Using the horizontal controls (Figure 3-2) you can display and horizontally scale a signal applied to the oscilloscope. Use the SEC/DIV control to select the horizontal scale factor and adjust the horizontal POSITION control as necessary.
Selecting the Vertical Mode and Scale

The vertical display controls allow you to adjust the vertical scale, position, and mode.

☐ **Step 1**: Select the channel you want with the CH1 BOTH CH2 switch:

- **CH 1** — Displays Channel 1 only.
- **BOTH** — Activates the ADD ALT CHOP switch for two-channel displays.
- **CH 2** — Displays Channel 2 only.

☐ **Step 2**: Preset the input coupling for that channel to ground (GND).
(Also refer to *Precharging the Signal Input*, page 3-2.)
Step 3: Set the vertical scale (or attenuation factor) for the display by turning the volts/division knob of the selected channel (Figure 3-3). Choose a setting that is several times higher than the amplitude of the signal. This will keep the display from going off screen.

Note the 1X and 10X nomenclature next to the VOLTS/DIV control. Vertical scale factors range from 2 mV to 5 V per division for a 1X probe and 20 mV to 50 V per division for a 10X probe. (Probes with higher factors of attenuation are also available from Tektronix.) If a probe is properly coded, the display readout of the channel it is connected to will change by the appropriate scale factor.

Figure 3-3: Vertical Display Controls

Step 4: Apply the signal to the input and move the coupling switch to AC (or DC). (Refer to Applying a Signals to the Vertical Inputs, page 3-1.)

Step 5: Adjust the vertical position control for the selected channel as necessary.

Setting the Display Intensity and Focus

Once you have a simple trace or signal displayed on the screen, use the FOCUS and INTENSITY knobs to control the CRT display (Figure 3-4).
Figure 3-4: CRT Display Controls

The INTENSITY STORE/READOUT control sets the brightness of the readouts in the NON-STORE mode as well as the intensity of the entire STORE display. You can also toggle the readouts on and off by turning the larger (outer) control fully counterclockwise and then back to the normal level.

Some readouts do not appear in both STORE and NON-STORE modes. Refer to Display Mode, page 2-6.

The FOCUS control adjusts the clarity of the display.

Finding “Lost” Displays

Because of signal variances or misadjusted front panel settings it is not uncommon to “lose” a signal display. When this happens, use the following procedure:

☐ Step 1: Note which channel the signal is applied to and make sure the vertical mode is set for that channel.

☐ Step 2: Set the oscilloscope in the NON-STORE mode.

☐ Step 3: Press the BEAM FIND button and hold it in. The beam of the CRT is now intensified and compressed into the viewing area (Figure 3-5).
Figure 3-5: Beam Find

If the beam appears to be stuck on some portion of the display, check the trigger mode settings. Setting the trigger mode to P-P AUTO will give you a sweep in the absence of a trigger signal. Also check to be sure the X-Y button is not pushed in and the seconds/division is not set too fast or too slow for the signal you are trying to display.

☐ **Step 4:** Adjust the horizontal and vertical position control(s) to center the signal display within the compressed area and then release the BEAM FIND button.

☐ **Step 5:** Adjust the INTENSITY control to a normal level and adjust the vertical and horizontal scale with the VOLTS/DIV and SEC/DIV controls.

If you fail to locate the sweep using this procedure you may want to use the basic analog setup given in the Start Up, page 1-4 and try reapplying the signal to the input.

---

**Digitizing Signals**

There are four different acquisition modes to choose from when you digitize a signal in the STORE mode:

- **Accumulate Peak** mode finds the highest and lowest record points over many acquisitions. It reveals variations in the signal over time.

- **Average** mode calculates the average value for each record point over many acquisitions. It reduces apparent noise in a repetitive signal.

- **Sample** mode records the first sample in every acquisition interval and presents more of a "real-time" view of the signal.
- **Peak Detect** mode uses the highest and lowest samples in two intervals. It reveals glitches and is relatively immune to waveform aliasing. (For further discussion of aliasing refer to Preventing Signal Aliases, page 3-18.)

Each sweep speed has a “default” setting for the acquisition mode. You can reset to these default modes anytime by selecting Factory Reset in the Advanced Functions menu. You can also set the oscilloscope to return to the default settings every time you power up the instrument. (See Saving and Recalling Setups, page 3-42)

Not all acquisition modes are available at all sweep speeds. The SEC/DIV and trigger mode settings determine the storage mode and corresponding set of available acquisition modes. Refer to Appendix D.

**Selecting the Acquisition Mode**

There are two ways to select the acquisition mode:

1. **Acquisition Menu** — Push the ACQ button under SETUP and press the menu button labeled Acq Mode.

2. **Front-Panel Acquisition Controls** — Push the MODE button on the front-panel bank of ACQUISITION switches.

**Selecting the High-Speed Storage Mode**

The “Repetitive Store” mode is indicated on the front panel for time base settings of 0.5 µs and faster. Because of the sampling rate (100 Ms/s) the oscilloscope must make numerous acquisitions at these speeds to complete a waveform record. The Repetitive Store mode, therefore, should only be used when acquiring repetitive signals.

**Selecting Slow-Speed Storage Modes**

For time base settings 0.1 s and slower, both the trigger mode and the roll or scan selection from the Acquisition Menu configures one of the following storage modes:

**Scan:**

- **Untriggered Scan** — (P-P AUTO) Each acquisition record appears left to right across the display and continually overwrites the previous record at the rate set by the SEC/DIV control. Untriggered Scan Mode is useful for viewing single, slowly occurring events that you do not want to trigger the oscilloscope on.

- **Triggered Scan** — (NORM) The acquisition record appears left to right across the display with every trigger. The oscilloscope overwrites the record left to right with new data only when there is another trigger. Triggered Scan Mode is useful for capturing single, slowly occurring events coincident with a trigger.
- **Scan-roll-scan** — (SGL SWP and Scan) A new record appears across the screen from left to right until it reaches the trigger point and then rolls right to left from the trigger point until a trigger occurs. When a trigger occurs, the oscilloscope scans left to right until the record is filled and then freezes the display. (Selecting either Average or Accpeak acquisition switches the storage mode to the equivalent of Triggered Scan, but only allows one acquisition or "single sweep.") Scan-roll-scan (or single-sweep scan) is useful for capturing an intermittent event and saving it on screen until the trigger is manually rearmed.

**Roll:**

- **Untriggered Roll** — (P-P AUTO or NORM) The waveform moves continuously across the screen from right to left like a chart recorder. Untriggered Roll mode is useful for viewing a series of events or slowly occurring, continuous events when no trigger is desired.

- **Triggered Roll** — (SGL SWP) The record moves across the screen continuously from right to left. When the trigger event occurs, the oscilloscope retains the waveform on screen and disables further acquisitions. Triggered Roll is useful for capturing an intermittent event and saving it on screen until the trigger is manually rearmed.

Refer to the following sections entitled *Viewing Slowly Occurring Events* and *Capturing Random Events* for further instructions on how to use the slow-speed storage modes.

**Viewing Slowly Occurring Events**

**Untriggered Scan Mode:**

View single, slowly occurring events that you do not want to trigger on.

- **Step 1:** Set the Trigger Mode to P-P AUTO.

- **Step 2:** Press the Setup ACQ button to call up the Acquisition Menu.

- **Step 3:** Select Scan and press the ACQ menu button again to exit the menu.

- **Step 4:** Note that the acquisition record appears across the screen from left to right, then repeatedly overwrites the previous record with new data (Figure 3-6).
Figure 3-6: Scan Mode

Triggered Scan Mode:

View single, slowly occurring events that you want to redisplay coincident with a new trigger.

☐ Step 1: Set the Trigger Mode to NORM.

☐ Step 2: Press the Setup ACQ button to call up the Acquisition Menu.

☐ Step 3: Select Scan and press the ACQ menu button again to exit the menu.

☐ Step 4: Note that a waveform record is acquired left to right with a trigger event. Each new trigger event then causes the acquisition to overwrite the previous record from left to right.

Untriggered Roll Mode:

View a series of events or slowly occurring, continuous events.

☐ Step 1: Set the Trigger Mode to P-P AUTO or NORM

☐ Step 2: Press the Setup ACQ button to call up the Acquisition Menu.

☐ Step 3: Select Roll and press the ACQ menu button again to exit the menu.

☐ Step 4: Note that the trace “rolls” across the screen from right to left (Figure 3-7) and does not permit any trigger event to interrupt the display.
Capturing Random Events

Infrequent or random events can be “captured” by using the single-sweep trigger mode in combination with either the Scan or the Roll mode. These two modes are called “Scan-roll-scan” and “Triggered Roll” respectively. These two modes are only available at sweep speeds of 0.1 ms and slower.

Triggered Roll:

☐ Step 1: Set the Trigger Mode to P-P AUTO.

☐ Step 2: Press the Acquisition TRIG POS button to select the position on the screen where the trigger event (“T”) will be displayed.

☐ Step 3: Press the Setup ACQ button to call up the Acquisition Menu.

☐ Step 4: Select Roll and press the ACQ menu button again to exit the menu.

☐ Step 5: Press the SGL SWP button.

Note that the trace moves across the screen continuously from right to left. Also, the READY light is on indicating the oscilloscope is waiting for a trigger signal. (If the READY light is not on, press the SGL SWP button again.)

When the trigger event occurs, the acquisition continues across the screen from right to left until it reaches the trigger point indicator. The oscilloscope then records the event coincident with the trigger, completes the record, and freezes the display.

Scan-roll-scan:

☐ Step 1: Set the Trigger Mode to P-P AUTO.

☐ Step 2: Press the Acquisition TRIG POS button to select the position on the screen where the trigger event (“T”) will be displayed.

☐ Step 3: Press the Setup ACQ button to call up the Acquisition Menu.
Step 4: Select Scan and press the ACQ menu button again to exit the menu.

Step 5: Press the SGL SWP button.

Note that the acquisition scans across the screen from left to right until it reaches the trigger point and then rolls right to left from the trigger point until a trigger occurs.

When a trigger occurs, the oscilloscope scans left to right until the record is filled and then freezes the display.

If you want to retain a waveform for later reference, transfer it to a SAVE REF memory location.

To rearm the trigger circuit, press SGL SWP again. The previous acquisition record will now disappear and the oscilloscope will be ready for the next trigger.

Accumulating Signal Peaks (ACCPEAK)

Acquiring signals in ACCPEAK (Figure 3-8) is the best mode to use when you want to observe the upper and lower boundaries of a signal’s amplitude over time. It will also indicate how much the DC component of the signal drifts or the amount of noise present in the signal.

![Figure 3-8: Accumulate Peak Mode Display](image)

Detecting Signal Glitches

A signal glitch is an aberrant spike that is not characteristic of the waveform or level it rides on. Both the ACCPEAK (accumulate peak) and PEAKDET (peak detect) modes are excellent modes for viewing signal glitches. (If you do not want to see these spikes AVERAGE mode is best. Refer to Averaging Signals, page 3-14.) While ACCPEAK gives the best view of signal glitches over time, PEAKDET mode is the best default mode (for sweep speeds of 5 µs and slower) because it automatically captures signal spikes and pres-
ents a truer view of the signal. Figure 3-9 shows how the signal in Figure 3-8 appears in the Peak Detect mode. Notice that the noise and glitches are detected, but not accumulated in Peak Detect.

![Peak Detect Mode Display](image)

**Figure 3-9: Peak Detect Mode Display**

### Averaging Signals

The AVERAGE mode (Figure 3-10) is excellent for visually eliminating random signal noise that rides on the waveform. Acquisitions are averaged over multiple records. The default weight of one acquisition is ¼ but it may be changed using the ACQUISITION menu.

![Average Mode Display](image)

**Figure 3-10: Average Mode Display**

### Sampling Signals

When you select SAMPLE the special features of the other modes are not used. The acquisition displayed is composed of 100 samples per division (Figure 3-11).
Clocking Acquisitions

Normally, storage acquisitions are clocked internally. You can, however, supply an external clocking signal through the auxiliary connector on the side of the instrument. Refer to Specification, Appendix B.

Selecting the Acquisition Record Length (1K/4K)

A 1K acquisition consists of 1,024 data points spread across one display screen. A 4K acquisition consists of 4,096 data points spread across four screens. To view these additional screens in the 4K mode you must use the cursor knob.

☐ Step 1: Press the ACQUISITION 1K/4K button. In the 4K mode an acquisition window indicator will appear.

The acquisition window indicator (Figure 3-12) displays the relative position of the cursors, what cursor is active, what part of the acquisition is displayed (display window indicator), and the trigger point.

☐ Step 2: Position the active cursor one way or the other to view the rest of the acquisition record. (Note that the active cursor and the display window indicator also move along the acquisition window indicator.)
Compressing the Acquisition Record Length (4K Compress)

You can compress a 4K acquisition to one screen. However only 1,024 data points are displayed.

☐ **Step 1:** Go to the STORE mode and display the signal in the 4K mode (Figure 3-13).

☐ **Step 2:** Turn the X10 CAL knob counterclockwise. Note that the timing increases by a factor of four, the small letter “c” appears before the time base readout, and the signal is compressed (Figure 3-14).

![Figure 3-13: 4K Acquisition, 1K Window](image1)

![Figure 3-14: Compressed 4K Acquisition](image2)
Positioning the Acquisition Record

The acquisition record can be positioned relative to the trigger point. Pressing the Acquisition button labeled TRIG POS moves the trigger point indicator ("T") to select three different views of the record:

- Pretrigger (Figure 3-15)
- Midtrigger (Figure 3-16)
- Posttrigger (Figure 3-17)

![Figure 3-15: Pretrigger Acquisition](image)

![Figure 3-16: Midtrigger Acquisition](image)
Figure 3-17: Posttrigger Acquisition

The trigger position is also “point selectable.” This means that the trigger point can be positioned anywhere along the acquisition record. Use the following procedure:

☐ **Step 1:** Press the Setup ACQ button to call up the Acquisition Menu.

☐ **Step 2:** Press the Cursor Knob Func button to select “Trig Pos.”

☐ **Step 3:** Turn the CURSORS knob to set the trigger point to the desired location.

The 4K acquisition mode extends the acquisition record and the cursor knob adjusts which portion of the record is displayed. Refer to *Selecting the Acquisition Record Length (1K/4K)*, page 3-15.

**Preventing Signal Aliases**

Aliasing may occur in the digital mode because the oscilloscope cannot sample the signal fast enough to construct an accurate waveform record (Figure 3-18). When aliasing happens, you see a waveform with a frequency lower than the actual signal on the input or a waveform that is not stable even though the light next to TRIG'D is lit.
Figure 3-18: Aliasing

One simple way to check for aliasing is to slowly change the horizontal scale (time per division setting). If the shape of the displayed waveform changes drastically, you may have aliasing.

There are a couple of ways to prevent signal aliasing:

- Set up the signal display in the NON-STORE mode before switching to STORE. While the oscilloscope is in the NON-STORE mode you can set the time base for an appropriate speed.

- Set up the signal display in another mode besides Sample. Because the Peak Detect mode, for example, searches for samples with the highest and lowest values, it can detect faster signal components over time.

Displaying Magnified Sweeps

There are a couple of ways to horizontally magnify the sweep:

- Change the time base to a faster sweep speed.

- Use the X10 control to magnify (by ten times) the center one division of the NON-STORE display or one division centered around the active cursor in the STORE mode. The X10 magnifier also extends the upper range of sweep speeds (for example, .05 μs to 5 ns per division).

Using the X10 Magnifier

The time per division readouts automatically change by the correct factor when the X10 knob is pulled. In the STORE mode an acquisition window indicator appears and CURSORS control can be used to scroll along the waveform.

Perform the following procedure to use the X10 magnifier in the NON-STORE mode:

- Step 1: Position the sweep until the portion of the sweep you want to magnify is centered horizontally on the display.

- Step 2: Pull out the X10 CAL PULL knob.
Displaying Signals

- **Step 3:** Adjust the horizontal position control as necessary to center the display.

Perform the following procedure to use the X10 magnifier in the **STORE** mode:

- **Step 1:** Center the active cursor on the portion of the sweep you want to magnify.

- **Step 2:** Pull out the **X10 CAL PULL** knob.

- **Step 3:** Adjust the **CURSORS** control as necessary to center the display.

---

Displaying Two Channels

By using both channels on the instrument you can compare one signal directly with another. With one signal in each channel it is also very easy to algebraically add them together or subtract them from each other.

### Comparing Two Signals

- **Step 1:** Connect one signal to Channel 1 and the other signal to Channel 2. Move the **CH1 BOTH CH2** switch to **BOTH**.

- **Step 2:** Move the **ADD ALT CHOP** switch to **ALT** or **CHOP**. (In general, it is better to use **CHOP** when the **SEC/DIV** control is set in the millisecond (ms) range, and **ALT** when the **SEC/DIV** is in the microsecond (μs) range.)

- **Step 3:** Position both signals on screen and adjust the vertical and horizontal scales.

### Adding Two Signals

- **Step 1:** Connect one signal to Channel 1 and the other signal to Channel 2. Move the **CH1-BOTH-CH2** switch to **ADD**.

- **Step 2:** Adjust the vertical position of the resultant display with both the Channel 1 and Channel 2 **POSITION** controls.

### Subtracting Signals or Signal Components

(Common Mode Rejection)

You can subtract an undesirable DC or AC signal component by inverting it in Channel 2 and adding it to Channel 1 (Figure 3-19).

- **Step 1:** Connect one signal to Channel 1 and the other signal or signal component you want to subtract to Channel 2. Move the **CH1-BOTH-CH2** switch to **ADD**.

- **Step 2:** Push the Channel 2 **INVERT** switch in.
Step 3: Adjust the vertical position of the resultant display with both the Channel 1 and Channel 2 POSITION controls.

Channel 1 signal with undesired AC component

Channel 2 with undesired AC component inverted

Channel 1 and Channel 2 (invert) in the ADD Mode. Undesired AC component is canceled.

Figure 3-19: Rejecting Common Mode Signal
Displaying X-Y Patterns

Phase and frequency relationships between two signals can be viewed in the X-Y mode by pressing the X-Y button on the front panel (Figure 3-20).

![Diagram of X-Y mode]

**Figure 3-20: Selecting the X-Y Mode**

The patterns displayed in the X-Y mode are called “Lissajous” figures. Some basic examples are given in Figures 3-21 and 3-22. With the X-Y button pressed in, the signal in Channel 1 drives the horizontal (or X) axis of the display and Channel 2 drives the vertical (or Y) axis.

Display two signals in the X-Y mode using the following procedure:

- **Step 1:** Connect one signal to Channel 1 and the other to Channel 2.
- **Step 2:** Adjust the VOLTS/DIV control for each channel. (If you want the amount of signal displacement to be exactly the same you may have to adjust the VOLTS/DIV CAL variable controls.)
- **Step 3:** Press the X-Y button in. The signal in Channel 1 now drives the horizontal (or X) axis of the display and Channel 2 drives the vertical (or Y) axis.

When using the X-Y mode, measuring the precise phase and frequency differences between the signals requires a little more skill than other techniques. Making X-Y measurements in the analog mode also requires that you take the performance characteristics of the oscilloscope into consideration for frequencies above 150 kHz. The digital mode, however, has the same bandwidth as the vertical system. Refer to the section on X-Y Operation in Specification, Appendix B.

Refer to *Measuring Frequency*, page 3-36, and *Measuring Phase Difference*, page 3-38, for more discussion about phase and frequency measurement techniques.
Figure 3-21: X-Y Phase Relationships

Frequency of the signal applied to X axis is twice that of the signal applied to the Y axis.

Frequency of the signal applied to Y axis is twice that of the signal applied to the X axis.

Figure 3-22: X-Y Frequency Relationships
Limiting Bandwidth

High-frequency noise from extraneous sources can sometimes interfere with a signal display. Push in the BW LIMIT button on the front panel to limit the vertical response of the scope to frequencies below 20 MHz. A “BWL” readout will also appear on the display.

Modulating the Display Intensity

The NON-STORE intensity may be modulated with an external signal applied to the External Z-Axis connection (Figure 3-23) located on the rear panel of the oscilloscope. Certain specifications of the instrument must be observed. Refer to the Z-Axis section of Specification, Appendix B.

Figure 3-23: External Z-Axis Connection
Triggering on Signals

Triggering is an important function of the oscilloscope that allows you to stabilize the display of a signal. The trigger circuit of the oscilloscope synchronizes the beginning of a sweep (or acquisition) with a particular point on the rising or falling edge of a trigger signal. Without a proper trigger, the signal display may either "free-run" or not appear at all.

Triggering on Repetitive Signals

Repetitive signals, such as a fixed-frequency sine wave (Figure 3-24), can supply their own trigger signal to synchronize the display. The **P-P AUTO** mode is the easiest mode to use for repetitive signals because it automatically adjusts the range of the trigger-level control and generates a sweep when no trigger signal is present.

- **Step 1**: Apply the repetitive signal to the Channel 1 input connector.
- **Step 2**: Set trigger mode to **P-P AUTO**.
- **Step 3**: Set the vertical mode to Channel 1 and the trigger **SOURCE to VERT MODE**. (The trigger signal is obtained from the signal applied to the selected channel; in this case, Channel 1.)
- **Step 4**: Set the **COUPL** switch to **NORM**.
- **Step 5**: Adjust the **TRIGGER LEVEL**, if necessary, to stabilize the display.
- **Step 6**: Adjust the vertical and horizontal controls to display a few cycles of the waveform.

![Figure 3-24: Repetitive Sine Wave](image)

\[
\Delta U = 0.05 \text{V} \quad \text{TRIG} = 0.6 \text{V} \quad f = 0.9960 \text{kHz}
\]

1V PEAKDET 0.2ms
Triggering on Low-Frequency Signals

Use the NORM trigger mode for signals that are lower than 20 Hz in NON-STORE or 500 Hz in STORE. If the repetitive signal is lower than these frequencies, the P-P AUTO circuit interferes with obtaining a stable trigger. This is because the P-P AUTO circuit will start to generate its own signal to trigger a sweep or acquisition.

(Note: NORM trigger mode is not the same as COUPL NORM.)

☐ Step 1: Apply the repetitive signal to the Channel 1 input connector.

☐ Step 2: Set trigger mode to NORM and the horizontal mode to A.

☐ Step 3: Set the vertical mode to Channel 1 and the trigger SOURCE to VERT MODE. (The trigger signal is obtained from the signal applied to the selected channel; in this case, Channel 1.)

☐ Step 4: Set the COUPL switch to NORM.

☐ Step 5: Adjust the TRIGGER LEVEL and VAR HOLDOFF, if necessary, to stabilize the display.

☐ Step 6: Adjust the vertical and horizontal controls to display a few cycles of the waveform.

☐ Step 7: Set the oscilloscope to STORE mode (Figure 3-25). Note that the annoying flicker of the NON-STORE display is removed.

Figure 3-25: Low-Frequency Signal in the STORE Mode

Triggering on Random or Infrequent Events

Sometimes the event that you want to display occurs very infrequently. The oscilloscope can be set up to capture these events. Refer to Capturing Random Events, page 3-12.
Triggering on Complex or Non-Repetitive Signals

Some signals are too complex or irregular to provide a usable trigger of their own. Circuits that carry digital information are a good example. Often, however, a signal from another part of the circuit, such as a more widely spaced clocking signal, will provide a meaningful trigger event. You can even view the trigger signal at the same time as the other signal with a two-channel display:

- **Step 1**: Connect one signal to Channel 1 and the trigger signal to Channel 2. Move the CH1 BOTH CH2 switch to CH 2.
- **Step 2**: Set the trigger mode to NORM and the SOURCE to CH 2.
- **Step 3**: Adjust the TRIGGER LEVEL to trigger on the signal.
- **Step 4**: Set the oscilloscope in STORE.
- **Step 5**: Move the CH1 BOTH CH2 switch to BOTH.
- **Step 6**: Move the ADD ALT CHOP switch to ALT or CHOP. (In general, it is better to use CHOP when the SEC/DIV control is set in the millisecond (ms) range, and ALT when the SEC/DIV is in the microsecond (µs) range.)
- **Step 7**: Position both signals on screen and adjust the vertical and horizontal scales.

![Triggering on Complex or Non-Repetitive Signals Diagram](image)

**Figure 3-26: Channel 1 Signal Triggered with Channel 2**

The STORE mode is ideally suited for viewing extended (4K) acquisitions and events that occur before during or after a trigger. Refer to *Selecting the Acquisition Record Length (1K/4K)*, page 3-15.

**Triggering on Line Frequency**

To trigger on power line signals, apply the signal to an input and move the COUPL switch to LINE SOURCE.
Triggering with an External Signal

Trigger one- or two-channel displays with an externally applied signal using the following procedure:

- **Step 1**: Apply the external signal to the **EXT INPUT** connector using a coaxial cable.
- **Step 2**: Set the **SOURCE** to **EXT**.
- **Step 3**: Select the **EXT COUPL** mode: **AC**, **DC**, or **DC ÷ 10**.
- **Step 4**: Adjust the **TRIGGER LEVEL** for a stable display.

Triggering on TV Signals

You can trigger on either TV line or TV field signals.

**Triggering on a TV Line Signal**

- **Step 1**: Push in the **P-P AUTO/TV LINE** trigger mode button.
- **Step 2**: Apply the TV signal to a channel input and display the channel.
- **Step 3**: Set the **VOLTS/DIV** switch to display 0.3 or more of composite video signal.
- **Step 4**: Set the **SEC/DIV** switch to **10 μs**.
- **Step 5**: Set the **TRIGGER SLOPE** switch either out (for positive-going TV Signal sync pulses) or in (for negative-going TV Signal sync pulses).
- **Step 6**: Adjust the **TRIGGER LEVEL** stabilize the display (Figure 3-27).

![Multi-burst Signal Triggered in TV Line](Figure 3-27: Multi-burst Signal Triggered in TV Line)

**Triggering on TV Field**

- **Step 1**: Set the **TRIGGER** Mode to **TV FIELD**. (Press the **P-P AUTO** and **NORM** modes buttons in at the same time.)
☐ Step 2: Apply the TV signal to a channel input and display the channel.

☐ Step 3: Set the VOLTS/DIV switch to display 2.5 divisions or more of composite video signal.

☐ Step 4: Set the TRIGGER SLOPE switch either out (for positive-going TV signal sync pulses) or in (for negative-going TV signal sync pulses).

☐ Step 5: Adjust the TRIGGER LEVEL to stabilize the display (Figure 3-28).

☐ Step 6: To display two separate fields individually, connect the TV signal to both CH 1 and CH 2 input connectors and select BOTH and ALT VERTICAL MODE.

☐ Step 7: Set the SEC/DIV switch to a faster sweep speed (displays of less than one full field). This will synchronize the Channel 1 display to one field and the Channel 2 display to the other field.

Figure 3-28: Multi-burst Signal Triggered in TV Field

Removing Unwanted Trigger Signal Components

Sometimes an unwanted high-frequency or low-frequency signal component can interfere with obtaining a stable trigger. To remove that component from the trigger signal, move the COUPL switch to either HF REJ or LF REJ. The HF REJ position attenuates trigger signal components above 40 kHz and the LF REJ position attenuates trigger signal components below 40 kHz.
Measuring Signals

*Measuring Signals* details how you can measure waveform displays in terms of time, amplitude, frequency, and phase.

---

**Measuring with the Graticule**

Although you can measure any signal with cursors in the **STORE** mode, it is sometimes just as easy to use the graticule (Figure 3-29).

![Figure 3-29: Measuring with the CRT Graticule](image)

Each major division is split into 5 minor divisions. One minor division equals two-tenths (0.2) of a major division.

The graticule is a graph that you can change the vertical and horizontal scale factors. The **VOLTS/DIV** setting (or readout) indicates the vertical scale for each major division. The **SEC/DIV** setting (or readout) indicates the horizontal scale for each major division. Each minor division represents two-tenths (0.2) of the major division value.

---

**Measuring with STORE Mode Cursors**

Cursor measurements are highly accurate and eliminate the calculations of graticule measurements. In **STORE** mode the oscilloscope simultaneously displays the voltage and time difference between the cursor pair. Using the **DISPLAY** menu you can also measure frequency by selecting $1/\Delta T$. 

---

2221A User Manual
Positioning the Cursors

A cursor is either active or inactive. A box surrounds the active cursor to signify that it can be positioned by the CURSORS knob. The inactive cursor does not have a box around it and will stay fixed while you position the other cursor (Figure 3-30).

![Diagram of cursor measurements]

**Figure 3-30: Cursor Measurements**

**Selecting a Cursor** — Select the cursor you want to position by pushing in the CURSORS knob.

**Selecting a Waveform** — On two-channel alternate and chop displays there are two pairs of cursors with one active cursor apiece. The active cursors of each pair track together when you move the cursor knob. When you have more than one waveform recalled from memory, however, you must use press the SELECT WAVEFORM button to move the cursors from one waveform to another.

**Measuring Voltage**

Make amplitude or other vertical measurements between two points on a waveform using this basic procedure:

- **Step 1:** Display the signal on screen so that the upper and lower points you wish to measure are on screen.

- **Step 2:** In NON-STORE mode use the graticule lines to make a measurement — or go to STORE mode and use the rest of this procedure.

- **Step 3:** In STORE mode, position a cursor on the lower point of the waveform using the cursor control.
□ Step 4: Push the CURSORS knob in to select the other cursor and position it on the upper point.

□ Step 5: Note the $\Delta$ volts (change or difference in volts) readout in the upper left corner of the display.

Figure 3-31 shows a typical Peak-to-peak voltage measurement.

![Graph](image)

Figure 3-31: Peak-to-Peak Measurement

Measuring Voltages in Reference to Ground

When a signal is DC coupled at the input, you can measure DC voltage levels, DC components of an AC signal (Figure 3-32), or other voltage levels in reference to ground (Figure 3-33). The procedure varies slightly depending on whether you use graticule lines or cursors to measure the DC level.

Graticule lines:

□ Step 1: Set the input coupling to GND and the trigger mode to P-P AUTO to display a flat trace on screen.

□ Step 2: Align the trace with a horizontal graticule line. This line is now the ground reference point.

□ Step 3: Set the input coupling to DC.

□ Step 4: The amount of vertical offset is the DC component.

Cursors:

□ Step 1: Set the oscilloscope to STORE.

□ Step 2: Set the input coupling to GND and wait a couple of seconds. The oscilloscope will now recognize this point as ground and place a small dot at the left side of the screen. (This dot may not be readily apparent if you have a flat line trace on screen.)

□ Step 3: Set the input coupling to DC.
Step 4: Move one of the cursors over to the left side of the display. When this cursor aligns with the ground reference dot the Δ symbol next to the volts readout changes to a ground symbol (Figure 3-32 and Figure 3-33).

Step 5: Position the other cursor to make the DC level measurement.

NOTE

You may have to reset the coupling switch to ground in order to obtain the ground reference dot if you change a front panel control setting.

![DC Component of an AC signal](image1)

Figure 3-32: DC Component of AC signal

![Ground-Referenced Voltage Measurement](image2)

Figure 3-33: Ground-Referenced Voltage Measurement
Using the Oscilloscope as a Digital Voltmeter — With ground-referenced cursors, you can also use the oscilloscope as a digital voltmeter for measuring ordinary DC voltages (Figure 3-34).

![Graph showing DC levels and cursors](image)

Figure 3-34: Measuring DC Levels with Cursors

Measuring Time with the Graticule or Cursors

Make period or other time measurements between two points on a waveform using this basic procedure:

☐ **Step 1:** Display the signal on screen so that the first point you wish to measure from is on screen.

☐ **Step 2:** In NON-STORE mode adjust the time base to place the other horizontal point on screen and use the graticule lines to make the measurement — or go to STORE mode and use the rest of this procedure.

☐ **Step 3:** In STORE mode, position a cursor on the first point of the waveform with the cursor control.

☐ **Step 4:** Push the CURSORS knob in to select the other cursor and position it on the second point. (On 4K or magnified displays an acquisition window indicator at the top of the display shows where the cursors are relative to the entire record length.)

☐ **Step 5:** Note the Δ time (change or difference in time) readout in the upper right corner of the display.
Figure 3-35 shows a typical period measurement.

Figure 3-35: Period Measurement

Measuring Frequency

Frequency is measured by calculating the inverse of a period measurement \((1/\Delta T)\). With a graticule measurement you would have to calculate this yourself. Using the Display menu, however, you can set the Store mode cursors to display the frequency:

☐ Step 1: Press the Setup DISPLAY button on the front-panel.

☐ Step 2: Push the left bezel button to place the selection box around “1/\Delta T.” Push the DISPLAY button again to return to the storage acquisition display.

☐ Step 3: Position a cursor on the rising edge of the waveform where it crosses a graticule line.

☐ Step 4: Push the CURSORS knob in to select the other cursor and position it at the same transition point on the next cycle of the signal (Figure 3-36).

☐ Step 5: Note the \(1/\Delta T\) (frequency) readout in the upper right corner of the display.
Measuring Signals

![Graph](image)

Figure 3-36: Cursor Frequency Measurement

**Measuring Rise Time and Fall Time**

Rise time is a measure of the time between the 10% and 90% points on the leading edge of a waveform (Figure 3-37). Fall time is a measure of time between the 90% and 10% points on the trailing edge of a waveform (Figure 3-38).

![Graph](image)

Figure 3-37: Measuring Rise Time
Figure 3-38: Measuring Fall Time

☐ Step 1: Apply a signal to the oscilloscope.

☐ Step 2: Set the trigger SLOPE out (positive) for a rise time measurement and in (negative) for a fall time measurement.

☐ Step 3: Adjust the vertical dimension for exactly 5 divisions (you may have to use the CAL variable.)

☐ Step 4: Vertically position the signal so that the bottom of the signal on the 0% graticule line and the top of the signal is on the 100% line.

☐ Step 5: Magnify the rising edge of the signal horizontally so that the rise time is spread over 4 or 5 divisions. (Refer to Displaying Magnified Sweeps, page 3-19.)

☐ Step 6: Measure the rise time horizontally from the 10(%) graticule line to the 90(%) graticule line.

Measuring Trigger Level

The trigger level is the point on the rising or falling edge of a signal where the oscilloscope triggers a sweep. This voltage level is indicated by the TRIG readout at the top of the CRT. TRIG1 represents the level of the trigger signal coming from Channel 1 and TRIG2 represents Channel 2.

Measuring Phase Difference

With the two vertical channels on the oscilloscope you can measure phase differences on signals that range in frequency anywhere within the limits of the vertical system. Use the following procedure:

☐ Step 1: Set both input coupling switches to the same position, depending on the type of input coupling desired.
Step 2: Using either probes or coaxial cables with equal time delays, connect a known reference signal to the Channel 1 input and the unknown signal to the Channel 2 input.

Step 3: Switch the Vertical Mode to BOTH and then select either ALT or CHOP.

Step 4: Set both VOLTS/DIV switches and both variable controls so the displays are equal in amplitude.

Step 5: Set the SOURCE to CH 1 so the oscilloscope uses only the reference signal for triggering. Adjust the TRIGGER LEVEL control for a stable display.

Step 6: Set the SEC/DIV switch to a sweep speed that displays about one full cycle of the reference waveform.

Step 7: Position the displays and adjust the SEC/DIV variable control so that one cycle of the reference signal occupies exactly 8 horizontal divisions. Each horizontal division of the graticule now represents 45° of the cycle (360° ÷ 8 divisions).

Step 8: Measure the horizontal difference in divisions between the signals and multiply it by 45° (Figure 3-39).

Figure 3-39: Measuring Phase Difference

For higher resolution measurements of the phase difference the display may be magnified horizontally by pulling the X10 magnification knob out (Figure 3-40).
Figure 3-40: Phase Difference in X10 Magnification
Saving Waveforms and Setups

The 2221A Digital Storage Oscilloscope not only provides reference memories for saving digitized waveforms, but also allows you to retain STORE mode setup configurations.

Saving and Recalling Waveforms

With the 2221A oscilloscope you can “freeze” a waveform with the touch of a button. You can also keep a waveform for later reference by using a SAVE REF memory location. The contents of the SAVE REF memory locations remain intact when the scope is turned off and can be recalled during a later session.

Saving the Current Acquisition

One way to quickly save a waveform is to use the SAVE/CONT button.

☐ Step 1: Acquire the signal in STORE mode.

☐ Step 2: Press the SAVE/CONT button. The current acquisition stops and the waveform is "frozen" on screen. (At sweep speeds of 50 ms or faster a triggered acquisition is allowed to complete before it is saved.)

☐ Step 3: Copy the waveform to a SAVE REF memory location if you want to retain the waveform for later reference. (Refer to the following section.)

☐ Step 4: Press the SAVE/CONT button again to continue with normal acquisition.

Saving Waveforms in SAVE REF Memory

In the 1K acquisition mode you can save up to three waveform displays in SAVE REF memory. In the 4K mode, because of the greater record length, you can save only one. Each SAVE REF memory location can hold either a one- or two-channel acquisition record.

☐ Step 1: Acquire the signal in STORE mode.

☐ Step 2: Select the desired 1K or 4K acquisition mode.

☐ Step 3: Press the SAVE REF button underneath the display (Figure 3-41). The current acquisition stops and a display readout appears that indicates the status of each memory location as either full or empty.

☐ Step 4: Press the memory location you want to save to or overwrite. If you wait more than 5 seconds to choose the memory location, the oscilloscope will continue with normal acquisition.
Recalling a Waveform from SAVE REF

Once a waveform is stored in a SAVE REF memory location, simply press the memory location button to recall or remove it from memory. The contents will remain intact even after the power is turned off. There is no overwrite protection on these memories, however. Pressing the SAVE REF and memory location button will save a new waveform to that location and overwrite the old.

Comparing Saved Waveforms

You can simultaneously display the contents of more than one SAVE REF memory location. This enables you to compare one saved waveform with another.

☐ Step 1: Press one or more memory location buttons to display their respective contents.

☐ Step 2: Press the SELECT WAVEFORM button (next to the cursor control) one or more times until the cursors appear on the waveform you want to measure. An underscore appears under the selected SREF memory number at the top of the display.

Saving and Recalling Setups

The oscilloscope can retain front-panel and menu setups, even after the power is turned off. You can also select the Power up State or group of setups that the instrument will recall when the power is turned back on.

Saving a Setup

Save and recall menu and acquisition setups by using the Save Setup Menu located under the ADV FUNCT menu.

☐ Step 1: Press the Setup ADV FUNCT button. The Advanced Functions menu appears.

☐ Step 2: Press the button underneath Save Setup Menu.
Step 3: Press the Select Setup menu button to select either Setup1 or Setup2 memory location for the setup information.

Step 4: Press Save Setup to save to current acquisition and menu settings to the selected memory location.

Recalling a Setup from Memory

Recall a saved setup either by returning to the ADV FUNCT/Save Setup Menu or by specifying the Power Up State as the particular setup you want to recall. (Refer also to the following section, Recalling a Power Up State.)

Step 1: Press the Setup ADV FUNCT button. The Advanced Functions menu appears.

Step 2: Press the button underneath Save Setup Menu.

Step 3: Press the Select Setup menu button to select either Setup1 or Setup2 memory location.

Step 4: Press Recall Setup to recall the acquisition and menu settings previously saved to that memory location.

Recalling a Power Up State

The oscilloscope can be configured to return to one of four setups when the instrument is turned on.

Step 1: Press the Setup ADV FUNCT button. The Advanced Functions menu appears.

Step 2: Press the button underneath Save Setup Menu.

Step 3: Press the button underneath Power Up State to select one of the following alternatives:

Default — The instrument will use the factory default settings when instrument powers up.

Pwr Dwn — The instrument will automatically save the software-controlled settings when the instrument is turned off. The instrument will return to these same settings when the instrument is turned back on.

Setup1 — The instrument will use the setup saved under Setup1 at power up.

Setup2 — The instrument will use the setup saved under Setup2 at power up.

Step 4: The selection is now saved. Press the ADV FUNCT button to return to normal operation.
Transmitting Waveforms

Digitized waveforms may be transmitted to an external device for printing, plotting, storage, or waveform analysis. Every instrument is equipped with an auxiliary connection for an analog X-Y plotter. Most applications, however, require either a GPIB (Option 10) or RS-232-C (Option 12) interface.

Communicating via Interface Options

The RS-232-C or GPIB interface is usually ordered as factory installed; however, you can order either interface separately for installation on existing instruments. (Only one interface can be installed in the instrument at a time.)

The two interface options are depicted in Figure 3-42 and Figure 3-43.

The 2221A, 2224, & 2232 Optional GPIB & RS-232-C Interfaces User Manual (070-8159-01) provides you with information about connecting the GPIB and RS-232-C communication options to external printers, plotters, or computer ports.

![Diagram of RS-232-C Interface](image)

Figure 3-42: RS-232 Interface (Option 12)
Plotting or Printing a Waveform

The auxiliary connection (Figure 3-44) is a standard feature on all instruments. The X, Y, and RELAY lines on the auxiliary connection allow you to drive an analog X-Y plotter. The section entitled X-Y Plotter Output in Appendix B supplies technical information pertaining to these outputs.
The 2221A, 2224, & 2232 Optional GPIB & RS-232 Interfaces User Manual (070-8159-01) provides you with information about using either interface option to drive a printer or plotter.

Plot Menu

The Plot menu (Figure 3-45) allows you to control and initiate the plot. Each item on the menu is described below.

![Plot Menu Diagram]

Figure 3-45: Plot Menu

Plotter Type

The Plotter Type menu button selects the analog X-Y Plotter or digital plotter output format. The digital output format requires a GPIB or RS-232 option.

XY — Analog X-Y plotter
HPGL — Hewlett-Packard® Graphics Language
EPS7 — Epson® low-speed
EPS8 — Epson® high-speed double-density
TJET — Hewlett-Packard® ThinkJet®

Grat

ON — Plots graticule lines.
OFF — Suppresses graticule lines.
Auto Plot

ON — Automatically plots acquisitions. The graticule and readouts are plotted on the first acquisition only. The oscilloscope will wait for each plot to finish before beginning another acquisition.

OFF — Disables Auto Plot.

XY Setup

XY Setup generates a pattern for calibrating analog X-Y plotter gain and offset.

Start

The Start menu button initiates transmission of the waveform display over the X-Y plotter or communications option.
Appendix A: Options and Accessories

This section describes the various options as well as the standard and optional accessories that are available for the 2221A Digital Storage Oscilloscope.

Options

The Options listed below may be ordered with the instrument or ordered separately:

Options A1—A5: International Power Cords

Besides the standard North American, 110 V, 60 Hz power cord, Tektronix ships any of five alternate power cord configurations with the oscilloscope when ordered by the customer.

<table>
<thead>
<tr>
<th>Option</th>
<th>Power Cord</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>Universal European — 220 V, 50 Hz</td>
</tr>
<tr>
<td>A2</td>
<td>UK — 240 V, 50 Hz</td>
</tr>
<tr>
<td>A3</td>
<td>Australian — 240 V, 50 Hz</td>
</tr>
<tr>
<td>A4</td>
<td>North American — 240 V, 60 Hz</td>
</tr>
<tr>
<td>A5</td>
<td>Switzerland — 220 V, 50 Hz</td>
</tr>
</tbody>
</table>

OPTION 10: GPIB Interface

The GPIB option may be ordered separately as a kit (F-10). The kit includes the user manual listed above as well as instructions for installation.

OPTION 12: RS-232-C Interface

Option 12 provides an RS-232-C serial communications interface. The interface implemented conforms to RS-232-C specifications. The option provides both DTE and DCE capability to aid in hooking up the various...
types of printers, plotters, personal computers, and modems that are available. The 2221A, 2224, & 2322 GPIB & RS-232-C Optional Interfaces User Manual (070-8159-xx) provides operating information for the Option 12 RS-232-C interface.

The Option 12 also includes a 10-foot, RS-232-C interface cable (012-0911-00) and a 25-pin male-to-male adapter (131-4923-00).

The RS-232-C option may be ordered separately as a kit (F-12). The kit includes all of the items listed above as well as instructions for installation.

OPTION 33: Travel Line

The Travel Line option provides impact protection needed for rough industrial and service environments. When the instrument is ordered with Option 33, it comes equipped with the accessory pouch, front panel cover, shock absorbing rubber guards mounted on the front and rear of the cabinet, an easy-to-use power-cord wrap, and a carrying strap.

The Travel Line option can be installed on existing instruments by ordering the Travel Line kit (040-1202-04).

OPTION 3R: Rackmount

Option 3R allows you to mount the 2221A into a standard 19 inch equipment rack.

---

Standard Accessories

The following standard accessories are included with the 2221A Digital Storage Oscilloscope:

Appendix B: Specification

In General Product Description you will find a listing of the traits of the 2221A Digital Storage Oscilloscope. Characteristic Tables, lists instrument characteristics of the oscilloscope in detail and the requirements that correspond to them.

General Product Description

The TEKTRONIX 2221A Digital Storage Oscilloscope is a portable, dual-channel oscilloscope suitable for use in a variety of test and measurement applications. It combines analog real-time (NON-STORE mode) and digital storage (STORE mode) capabilities to provide a 100 MHz analog bandwidth and up to a 100 Megasample/second digital sampling rate.

Vertical System

The vertical system offers the following features:

- Calibrated deflection factors from 2 mV to 5 V per division for both channels
- Variable VOLTS/DIV gain control that increases the deflection factor at least 2.5 to 1 for any VOLTS/DIV setting of either channel
- Vertical display modes CH 1, CH 2, and BOTH, with a choice in BOTH of ADD, ALT, or CHOP
- Bandwidth limiting that reduces bandwidth of the vertical amplifier system and the trigger system to 20 MHz

Horizontal System

The horizontal system offers the following features:

- Calibrated SEC/DIV settings that range from 0.5 s to 50 ns per division
- Variable SEC/DIV control that increases the non-store sweep time per division up to four times the calibrated time per division set by the SEC/DIV switch
- Horizontal magnification by X10 (extends the fastest sweep-speed time of 50 ns per division to 5 ns per division)

Digital Storage System

The digital storage offers the following features:

- Sampling at a maximum rate of 100 megasamples per second with both channels sampled simultaneously
- Glitch-catching capabilities for glitch widths as narrow as 10 ns
- Acquisition of waveforms in any of four acquisition modes: SAMPLE, AVERAGE, ACCPEAK, and PEAKDET (peak detect is available only at SEC/DIV settings slower than 2 μs)
- Maximum stored record lengths per waveform of either 4096 bytes (4 K) for single-channel acquisitions or 2048 bytes (2 K) for dual-channel acquisitions (ALT or CHOP)
- Four calibrated storage time bases of 1, 2, and 5 s per division for low-frequency signal acquisitions using X10 STORE ONLY button
- Compression of the 4 K acquisition record into a 1 K acquisition record using the Variable SEC/DIV control (4 K Compress mode)
- Storage of up to three 1 K records (512 data points per waveform when dual-channel records are stored) or one 4 K record (2 K per waveform when dual-channel acquisitions are stored) in the SAVE REF memory

User Interface

An internal microprocessor provides front panel control and feedback on control settings.

Front Panel Controls — This oscilloscope uses a combination of front-panel buttons, knobs, and on-screen menus to control its many functions. The front-panel controls are grouped according to function: vertical, horizontal, trigger, setup, and acquisition.

Almost all NON-STORE (analog real-time) and STORE mode functions are set using front panel controls, which allows them to be quickly adjusted. Some setup functions, such as SETUP ACQ and DISPLAY, are set indirectly using menus.

Display — An internal microprocessor reads the front-panel controls to determine their settings and generates on-screen readouts of many of those settings. Settings are displayed for the following controls:

- VOLTS/DIV knobs and AC-GND-DC switches for both channels
- SEC/DIV knob
- Voltage and Time CURSOR measurement readouts (on STORE Mode displays only)
- Trigger LEVEL knob

Additional readout information is displayed when in STORE (digital) mode. Shown are the acquisition mode, names of any SAVE REF memories displayed, SAVE if SAVE/CONT is so set, and SWEEP LIMIT if it is active.
Since all information just listed is read out on screen, it appears on all hard copies made by the oscilloscope. Therefore, hard copies of waveform plots will also document the setup and measurement information associated with the waveform.

**Measurement Features**

You can measure voltage or time on both NON-STORE (analog) and STORE (digital) waveforms using the graticule. For STORE mode waveforms, you can also measure voltage and time using CURSORS. (Waveforms can be current acquisitions or SAVE REF acquisitions.)

The cursors are toggled to any displayed waveform of interest and then positioned using the CURSORS knob to any two points of interest on the waveform. The ΔV and ΔT readouts indicate the voltage difference and timing difference between the positions of the cursors.

For 4 K acquisition records, the CURSORS knob also scrolls the record back and forth horizontally, so any 1 K portion can be viewed on screen. (The screen can only display 1 K record points.)

**Options and Accessories**

For part numbers and information about both standard and optional accessories, refer to Options and Accessories which begins on page A-1 of this manual. Your Tektronix representative, local Tektronix Field Office, or Tektronix products catalog can also provide additional accessories information.

**Performance Conditions**

The following electrical characteristics (Table A-4) are valid when the instrument has been adjusted at an ambient temperature between +20° C and +30° C (+68° F and 86° F), has had a warm-up period of at least 20 minutes, and is operating at an ambient temperature between 0° C and +50° C (32° F and 122° F), unless otherwise noted.
Characteristic Tables

The characteristics listed in the tables that follow are valid when the performance conditions just listed are met. Items listed in the “Performance Requirements” column are verifiable qualitative or quantitative limits that define the measurement capabilities of the oscilloscope.

Environmental characteristics are given in Table A-5 on page A-22. This oscilloscope meets the requirements of MIL-T-28800D for Type III, Class 5 equipment, except where noted otherwise.

Physical characteristics of the oscilloscope are listed in Table A-6 on page A-23.

¹ Performance requirement not checked in manual.

²Useful storage performance is limited to the frequency where there are 10 samples per sine wave signal period at the maximum sampling rate. (Maximum sampling rate is 100 MHz.) This yields a maximum amplitude uncertainty of 5%. Accuracy at the useful storage bandwidth limit is measured with respect to a six-division, 50 kHz reference sine wave.

</tr>
</tbody>
</table>

\(^1\)Performance requirement: not checked in manual.

\(^4\)Holdoff in STORE mode is a function of microprocessor activity and the pretrigger acquisition. The VAR HOLDOFF control maintains some control over the STORE holdoff by preventing a new trigger from being accepted by the storage circuitry until the next (or current, if one is in progress) NON-STORE holdoff has completed.

Figure A-2: Physical dimensions of the 2221A Digital Storage Oscilloscope
Appendix C: Performance Verification

This appendix begins with General Information which contains topics you should understand before performing the procedures in this appendix. The table Test Equipment Required follows. The performance checks are found under Procedures.

General Information

Read the following topics before performing the performance verification procedures in this appendix.

Purpose

The Performance Verification is used to verify the instrument against the performance requirements listed in Table A-4 (page A-8) and to determine the need for instrument adjustment. It may also be used as an acceptance test or as a preliminary troubleshooting aid.

Performance Check Interval

To ensure instrument accuracy, check its performance after every 2000 hours of operation or once each year, if used infrequently. A more frequent interval may be necessary, if the instrument is subjected to harsh environments or severe usage.

Structure

The Performance Verification is structured in subparts to permit checking individual sections of the instrument, whenever a complete verification of performance is not required.

Each subpart begins with a list of the test equipment required for performing the steps in that subpart. Following that equipment list is a list of all the front-panel control settings required to prepare the instrument for performing Step 1 of that subpart. The procedure steps follow.

When performing any subpart, start at the beginning and do each step within a particular subpart—both in the sequence presented and in its entirety—to ensure that control-setting changes will be correct for following steps.

Limits and Tolerances

The tolerances given in this procedure are valid for an instrument that is operating in and has been previously calibrated in an ambient temperature between +20°C and +30°C. The instrument also must have had at least a 20 minute warm-up period. Refer to Table A-4 for tolerances applicable to an
instrument that is operating outside this temperature range. All tolerances specified are for the instrument only and do not include test-equipment error.

## Test Equipment Required

Table A-7 lists all the test equipment required to do the Performance Verification in this appendix. Also listed is the minimum specifications for the test equipment. All equipment used must meet or exceed its minimum specifications.

When equipment other than that recommended is used, control settings of the test setup might need to be altered. If the exact item of equipment given as an example in Table A-7 is not available, check the Minimum Specification column to determine if any other available test equipment might suffice to perform the check or adjustment.

Operating instructions for test equipment are not given in this procedure. If more operating information is required, refer to the appropriate test equipment instruction manual.

### Table A-7: Test Equipment Required

<table>
<thead>
<tr>
<th>Item and Description</th>
<th>Minimum Specification</th>
<th>Purpose</th>
<th>Example of Suitable Test Equipment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calibration Generator</td>
<td>Standard-amplitude signal levels: 5 mV to 50 V. Accuracy ±0.3%. High-amplitude signal levels: 1 V to 60 V. Repetition rate: 1 kHz. Fast-rise signal level: 1 V. Repetition rate: 1 MHz. Rise time: 1 ns or less. Flatness: ±2%.</td>
<td>Signal source for gain and transient response.</td>
<td>TEKTRONIX PG 506A Calibration Generator.¹</td>
</tr>
<tr>
<td>Leveled Sine Wave Generator</td>
<td>Frequency: 250 kHz to above 100 MHz. Output amplitude: variable from 10 mV to 5V p-p. Output impedance: 50 Ω. Reference frequency: 50 kHz. Amplitude accuracy: constant within 3% of reference frequency as output frequency changes.</td>
<td>Vertical, horizontal, and triggering checks and adjustments. Display adjustments and Z-Axis check.</td>
<td>TEKTRONIX SG 503 Leveled Sine Wave Generator.¹</td>
</tr>
<tr>
<td>Time-Mark Generator</td>
<td>Marker outputs: 10 ns to 0.5 s. Marker accuracy: ± 0.1%. Trigger output: 1 ms to 0.1 ms, time-coincident with markers.</td>
<td>Horizontal checks and adjustments. Display adjustment.</td>
<td>TEKTRONIX TG 501 Time-Mark Generator.¹</td>
</tr>
<tr>
<td>Low-Frequency Generator</td>
<td>Range: 1 kHz to 500 kHz. Output amplitude: 300 mV. Output impedance: 600 Ω. Reference frequency: constant within 0.3 dB of reference frequency as output frequency changes.</td>
<td>Low-frequency trigger checks.</td>

¹Requires a TM500-Series Power Module.
Procedures

These procedures check all characteristics in Appendix B except those marked not checked. Be sure you have read General Information on page A-25, including Limits and Tolerances before doing these procedures.

For a list of each check and the page number on which it is found, see the Performance Verification entries in the index at the rear of this manual.

Initial Setup Procedure

Before performing any procedures, note the following items:

- It is not necessary to remove the instrument cover to accomplish any procedure in this Performance Verification, since all checks are made using operator-accessible front- and rear-panel controls and connectors.
- To make accurate display adjustments and checks, you want a stable, well-focused, low-intensity display. Therefore, unless otherwise noted, adjust the INTENSITY, STORAGE/READOUT INTENSITY, FOCUS, and Trigger LEVEL control as needed to view the display when performing procedures.

Before doing the procedures that follow, perform these four steps to ensure performance accuracies for the digital portion of the instrument. Performance of the Factory Reset routine sets the digital part of the instrument to factory default settings.

Procedure Steps:

☐ Step 1: Power on the instrument and allow it to warm up 20 minutes before doing the procedures that follow.

☐ Step 2: Press the Setup ADV FUNCT button to display the Advanced Functions setup menu.

☐ Step 3: Press the Fact. Reset menu button to set the instrument to factory default settings.

☐ Step 4: Return the instrument to display mode by pressing the Setup ADV FUNCT button a second time.

Vertical System Checks

These procedures check those characteristics that relate to the vertical system and that are listed as checked in Appendix B of this manual.

Procedure Steps:

☐ Step 1: Check Deflection Accuracy and Variable Range

a. Connect the standard-amplitude signal from the calibration generator via a 50 Ω cable to the CH 1 OR X input connector.

b. CHECK — Deflection accuracy is within the limits given in Table A-8 for each CH 1 VOLTS/DIV switch setting and corresponding standard-amplitude signal.

When at the 20 mV VOLTS/DIV switch setting, rotate the CH 1 VOLTS/DIV Variable control fully counterclockwise and CHECK that the display decreases to 2 divisions or less. Then return the CH 1 VOLTS/DIV Variable control to the CAL detent and continue with the 50 mV check.

</table>

c. Move the cable from the CH 1 OR X input connector to the CH 2 OR Y input connector. Set the Vertical MODE switch to CH 2.

d. Repeat part b using the CH 2 controls.

☐ Step 2: Check Store Deflection Accuracy

a. Set:
   CH 2 VOLTS/DIV
   STORE/NON-STORE
   Acquisition MODE
   STORE (button in)
   AVERAGE

b. Set the generator to produce a five division standard amplitude signal.

c. Use the CURSORS control and SELECT C1/C2 switch (push in the CURSORS controls knob) to set one cursor at the bottom of the square wave and the other cursor at the top of the square wave.

d. CHECK — Deflection accuracy is within the limits given in Table A-9 for each CH 2 VOLTS/DIV switch setting and corresponding standard-amplitude signal.

e. Move the cable from the CH 2 OR Y input connector to the CH 1 OR X input connector. Set the Vertical MODE switch to CH 1.

f. Repeat parts b and c using the CH 1 controls.

<td>19.40 to 20.60 V</td>
</tr>
</tbody>
</table>

- **Step 3:** Check Save Expansion and Compression
  a. Set the CH 1 VOLTS/DIV switch to 0.1 V.
  b. Set the generator to produce a 0.5 division standard-amplitude signal.
  c. Press in the SAVE/CONT button to select SAVE.
  d. Set the CH 1 VOLTS/DIV switch to 10 mV and reposition the display.
  e. CHECK—The display is expanded to five divisions in amplitude.
  f. Set:
     CH 1 VOLTS/DIV
     SAVE/CONT
     0.1 V
     CONT
  g. Set the generator to produce a five division standard-amplitude signal.
  h. Press in the SAVE/CONT button to select SAVE.
  i. Set the CH 1 VOLTS/DIV switch to 1 V.
  j. CHECK—The display is compressed to 0.5 division in amplitude.
  k. Move the cable from the CH 1 OR X input connector to the CH 2 OR Y input connector.
  l. Set:
     Vertical MODE
     SAVE/CONT
     CH 2
     CONT
m. Repeat parts a through j, using the **CH 2 VOLT/DIV** control.

**Step 4:** Check Position Range

a. Disconnect the calibration generator from the **CH 2** input connector and connect the leveled sine-wave generator output via a 50 Ω cable and a 50 Ω termination to the **CH 2** input connector.

b. Set:
   
   VOLTS/DIV (both)  0.1 V
   AC-GND-DC (both)  AC

c. Set the generator to produce a 50 khz, two division display.

d. Set the **CH 2 VOLTS/DIV** switch to 10 mV.

e. Rotate the **CH 2 POSITION** control fully clockwise.

f. CHECK — That the bottom of the waveform is positioned at least 1 division above the center horizontal graticule line.

g. Rotate the **CH 2 POSITION** control fully counterclockwise.

h. CHECK — That the top of the waveform is positioned at least 1 division below the center horizontal graticule line.

i. Move the cable from the **CH 2** input connector to the **CH 1** input connector and set the Vertical **MODE** switch to **CH 1**.

j. Repeat parts d through h using the Channel 1 controls.

**Step 5:** Check Acquisition Position Registration

a. Set:
   
   AC-GND-DC (both)  GND
   SEC/DIV  0.5 ms

b. Position the trace exactly on the center horizontal graticule line using the **CH 1 POSITION** control.

c. Set:
   
   STORE/NON-STORE  STORE (button in)
   SAVE/CONT  CONT

d. CHECK — Trace remains within 0.5 division of the center graticule line.

e. Set:
   
   Vertical **MODE**
   STORE/NON-STORE  **CH 2**
   NON-STORE (button out)

f. Repeat parts b through d for **CH 2** trace, using the **CH 2** controls.

g. Position the trace 0.5 division below the top horizontal graticule line using the **CH 2 POSITION** control.

h. Press in the **SAVE/CONT** button to select **SAVE**.

i. CHECK — Trace shift of 0.5 division or less.
j. Press in the **SAVE/CONT** button to select **CONT**.

k. Position the trace 0.5 division above the bottom horizontal graticule line using the **CH 2 POSITION** control.

l. Press in the **SAVE/CONT** button to select **SAVE**.

m. CHECK — Trace shift of 0.5 division or less.

n. Press in the **SAVE/CONT** button to select **CONT**.

o. Set the Vertical **MODE** switch to **CH 1**.

p. Repeat steps g through m for **CH 1** trace.

**Step 6: Check Bandwidth**

a. Set:
   - **VOLTS/DIV** (both) . 2 mV
   - **AC-GND-DC** (both) DC
   - **SEC/DIV** 0.2 ms
   - **BW LIMIT** Off (button out)
   - **STORE/NON-STORE** NON-STORE (button out)

b. Connect the leveled sine wave generator output via a 50 Ω precision cable and a 50 Ω termination to the **CH 1 OR X** input connector.

c. Set the generator to produce a 50 kHz, six division display.

d. CHECK — Display amplitude is 4.2 divisions or greater as the generator output frequency is increased up to the value shown in Table A-10 for the corresponding **VOLTS/DIV** switch setting.

<table>
<thead>
<tr>
<th><strong>VOLTS/DIV Switch Setting</strong></th>
<th><strong>Generator Output Frequency</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>2 mV</td>
<td>80 MHz</td>
</tr>
<tr>
<td>5 mV to 0.5 V</td>
<td>100 MHz</td>
</tr>
</tbody>
</table>

e. Repeat parts c and d for all indicated **CH 1 VOLTS/DIV** switch settings, up to the output-voltage upper limit of the sine wave generator being used.

f. Move the cable from the **CH 1 OR X** input connector to the **CH 2 OR Y** input connector.

g. Set the Vertical **MODE** switch to **CH 2**.

h. Repeat parts c and d for all indicated **CH 2 VOLTS/DIV** switch settings, up to the output-voltage upper limit of the sine wave generator being used.
Step 7: Check Repetitive Store Mode and Bandwidth

a. Set:
   CH 2 VOLTS/DIV 10 mV
   SEC/DIV 0.2 ms

b. Set the generator to produce a 50 kHz, six division display.

c. Set:
   SEC/DIV 0.05 μs
   X10 Magnifier On (knob out)

d. Set the generator to produce a 100 MHz display.

e. Set:
   STORE/NON-STORE STORE (button in)
   SAVE/CONT CONT

   **NOTE**

   Allow the points to accumulate for a few seconds before saving the display.

f. Press in the SAVE/CONT button to select SAVE.

g. CHECK — The 100 MHz display is saved.

h. CHECK — Display amplitude is 4.2 divisions or greater.

i. Press in the SAVE/CONT button to select CONT.

j. Set the Vertical MODE switch to BOTH and ALT.

k. Repeat parts f through h.

Step 8: Check Single Sweep Sample Acquisition

a. Set:
   Vertical MODE CH 2
   SEC/DIV 5 μs
   X10 Magnifier Off (knob in)
   Trigger Mode NORM
   SOURCE CH 2
   SAVE/CONT CONT

b. Set the generator to produce a 50 kHz, six division display.

c. Press in the Trigger Mode SGL SWP button.

d. Set the generator output to 2 MHz.

e. Press in the Trigger Mode SGL SWP button.

f. CHECK — the minimum peak-to-peak envelope amplitude is greater than 5.6 divisions.
Step 9: Check Bandwidth Limit Operation

a. Set:
   - BW LIMIT
   - VOLTS/DIV (both)
   - AC-GND-DC (both)
   - SEC/DIV

   Trigger Mode
   SOURCE
   MODE STORE/NON-STORE

   On (button in)
   10 mV
   DC
   20 μs
   P-P AUTO
   Vertical
   NON-STORE (button out)

b. Set the generator to produce a 50 kHz, six division display.

c. Adjust the generator output frequency until the display amplitude decreases to 4.2 divisions.

d. CHECK — Generator output frequency is between 18 and 22 MHz.

e. Move the cable from the CH 2 OR Y input connector to the CH 1 OR X input connector.

f. Set the Vertical MODE switch to CH 1.

g. Repeat parts c and d.

h. Disconnect the test equipment from the instrument.

Step 10: Check Common-Mode Rejection Ratio

a. Set:
   - BW LIMIT
   - INVERT

   Off (button out)
   On (button in)

b. Connect the leveled sine wave generator output via a 50 Ω cable, a 50 Ω termination, and a dual-input coupler to the CH 1 OR X and the CH 2 OR Y input connectors.

c. Set the generator to produce a 50 MHz, six division display.

d. Vertically center the display using the CH 1 POSITION control. Then set the Vertical MODE switch to 2 and vertically center the display using the CH 2 POSITION control.

e. Set the Vertical MODE switches to BOTH and ADD.

f. CHECK — Display amplitude is 0.6 division or less.

g. If the check in part f meets the requirement, skip to part p. If it does not, continue with part h.

h. Set the Vertical MODE switch to CH 2.

i. Set the generator to produce a 50 kHz, six division display.

j. Set the Vertical MODE switch to BOTH.
k. Adjust the CH 1 or CH 2 VOLTS/DIV Variable control for minimum display amplitude.

l. Set the Vertical MODE switch to CH 2.

m. Set the generator to produce a 50 MHz, six division display.

n. Set the Vertical MODE switch to BOTH.

o. CHECK — Display amplitude is 0.6 division or less.

p. Disconnect the test equipment from the instrument.

☐ Step 11: Check Non-Store and Store Channel Isolation

a. Set:
   Vertical MODE CH 1
   VOLTS/DIV (both) 0.1 V
   VOLTS/DIV Variable (both) CAL detent
   INVERT Off (button out)
   CH 1 AC-GND-DC DC
   CH 2 AC-GND-DC GND
   SEC/DIV 0.1 µs

b. Connect the leveled sine wave generator output via a 50 Ω cable and a 50 Ω termination to the CH 1 OR X input connector.

c. Set the generator to produce a 50 MHz, five division display.

d. Set the Vertical MODE switch to CH 2.

e. CHECK — Display amplitude is 0.05 division or less.

f. Move the cable from the CH 1 OR X input connector to the CH 2 OR Y input connector.

g. Set:
   Vertical MODE CH 1
   CH 1 AC-GND-DC GND
   CH 2 AC-GND-DC DC

h. CHECK — Display amplitude is 0.05 division or less.

i. Set:
   CH 2 VOLTS/DIV 50 mV
   STORE/NON-STORE STORE (button in)
   SAVE/CONT CONT

j. CHECK — Display amplitude is 0.1 division or less.

k. Move the cable from the CH 2 OR Y input connector to the CH 1 OR X input connector.

l. l. Set:
   Vertical MODE CH 2
   CH 1 VOLTS/DIV 50 mV
   CH 2 VOLTS/DIV 0.1 V
   CH 1 AC-GND-DC DC
   CH 2 AC-GND-DC GND
m. CHECK — Display amplitude is 0.1 division or less.

n. Disconnect the test equipment from the instrument.

☐ Step 12: Check Store Pulse Width Amplitude

a. Set:
   CH 2 VOLTS/DIV
   CH 2 AC-GND-DC
   SEC/DIV
   X10 Magnifier
   STORE/NON-STORE
   0.5 V
   AC
   0.05 μs
   On (knob out)
   NON-STORE (button out)

b. Connect the pulse generator pulse-period output via a 50 Ω coaxial cable and a 50 Ω termination to CH 2 or Y input connector.

c. Set the generator to produce a 0.1 ms period, 10 ns pulse duration, five division display.

d. Set X10 Magnifier off (knob in).

e. Set the Pulse Generator period to 1 ms.

f. Set SEC/DIV to 1 ms.

g. Set:
   STORE/NON-STORE
   Acquisition MODE
   STORE (button in)
   PEAKDET

h. Adjust Horizontal POSITION control to center trace horizontally.

i. CHECK — The amplitude of the display is 2.5 divisions or greater.

j. Set the SEC/DIV switch to 0.1 sec.

k. CHECK — The amplitude of the display is 2.5 divisions or greater.

l. Disconnect the test equipment from the instrument.

Horizontal System Checks

Equipment Required (see Table A-7):
Calibration Generator
   50 Ω BNC Precision

Procedure Steps:

☐ Step 1: Check Timing Accuracy and Linearity

a. Connect the time-mark generator output via a 50 Ω cable and a 50 Ω termination to the CH 1 OR X input connector.

b. Select 50 ns time markers from the time-marker generator.

c. Use the CH 1 POSITION control to center the display vertically. Adjust the Trigger LEVEL control for a stable, triggered display.

d. Use the Horizontal POSITION control to align the 2nd time marker with the 2nd vertical graticule line.

e. CHECK — Timing accuracy is within 2% (0.16 division at the 10th vertical graticule line), and linearity is within 5% (0.1 division over any 2 of the center eight divisions).

f. Repeat parts c through e for the remaining SEC/DIV and time-mark generator setting combinations shown in Table A-11 under the Normal (X1) column.

When checking the timing accuracy of the SEC/DIV switch settings from 50 ms to 0.5 s, watch the time marker tips only at the 2nd and 10th vertical graticule lines while adjusting the Horizontal POSITION control.

g. Set:
SEC/DIV
X10 Magnifier
0.05 μs
On (knob out)

h. Select 10 ns time markers from the time-mark generator.

i. Use the Horizontal POSITION control to align the 1st time marker that is 40 ns beyond the start of the sweep with the 2nd vertical graticule line.
j. CHECK — Timing accuracy is within 3% (0.24 division at the 10th vertical graticule line), and linearity is within 7.5% (0.15 division over any two of the center eight divisions). Exclude any portion of the sweep past the 100th magnified division.

k. Repeat parts i and j for the remaining SEC/DIV and time-mark generator setting combinations shown in Table A-11 under the X10 Magnified column.

</tbody>
</table>
Step 2: Check Store Differential and Cursor Time Difference Accuracy

a. Set: CH 1 AC-GND-DC
   SEC/DIV
   X10 Magnifier
   STORE/NON-STORE
   GND
   0.1 ms
   Off (knob in)
   STORE (button in)

b. Use the CH 1 POSITION control to center the base line vertically and the Horizontal POSITION control to align the start of the trace with the 1st vertical graticule line.

c. Using the CURSORS control and SELECT C1/C2 (push in the CURSORS control knob) switch, select one of the two cursors and set it exactly on the 2nd vertical graticule line. Select the other cursor and move it towards the right until the ΔT readout displays 0.800 ms.

d. CHECK — Graticule indication of cursor difference at the 10th vertical graticule line is within 0.16 division.

e. Set the CH 1 AC-GND-DC switch to DC.

f. Select 0.1 ms time markers from the time-mark generator.

g. Align the 2nd time marker with the 2nd vertical graticule line using the Horizontal POSITION control.

h. Press in the SAVE/CONT button to select SAVE for a stable display.

i. Use the CURSORS control and SELECT C1/C2 (push in the CURSORS control knob) switch to set the first cursor on the trailing edge of the 2nd time marker.

j. Press in the CURSORS control knob again to activate the second cursor.

k. Set the second cursor on the trailing edge of the 10th time marker at the same voltage level as on the 2nd time marker.

l. CHECK — The ΔT readout is between 0.798 ms and 0.802 ms.

m. Press in the SAVE/CONT button to select CONT.

n. Set the SEC/DIV switch to 0.5 μs.

o. Select 0.5 μs time markers from the time-mark generator.

p. Align the 2nd time marker with the 2nd vertical graticule line using the Horizontal POSITION control.

NOTE

Allow the points to accumulate for a few seconds before saving the display.

q. Repeat parts h through k.
NOTE

Pulses with fast rise and fall times have only a few sample points and it may not be possible to place the cursors at exactly the same voltage levels.

r. CHECK — The ΔT readout is between 3.990 µs and 4.010 µs.

☐ Step 3: Check Variable Range

a. Set:
   SEC/DIV 0.2 ms
   SEC/DIV Variable Fully counterclockwise
   STORE/NON-STORE NON-STORE (button out)

b. Select 0.5 ms time markers from the time-mark generator.

c. CHECK — Time markers are one division or less apart.

☐ Step 4: Check Position Range

a. Set:
   SEC/DIV 10 µs

b. Select 10 µs time markers from the time-mark generator.

c. CHECK — Start of the sweep can be positioned to the right of the center vertical graticule line by rotating the Horizontal POSITION control fully clockwise.

d. CHECK — The 11th time marker can be positioned to the left of the center vertical graticule line by rotating the Horizontal POSITION control fully counterclockwise.

e. Select 50 µs time markers from the time-mark generator.

f. Align the 3rd time marker with the center vertical graticule line using the Horizontal POSITION control.

g. Set the X10 Magnifier knob to On (knob out).

h. CHECK — Magnified time marker can be positioned to the left of the center vertical graticule line by rotating the Horizontal POSITION control fully counterclockwise.

i. CHECK — Start of the sweep can be positioned to the right of the center vertical graticule line by rotating the Horizontal POSITION control fully clockwise.

☐ Step 5: Check Store Expansion Range

a. Set:
   SEC/DIV 0.1 ms
   X10 Magnifier Off (knob in)
b. Select 10 μs time markers from the time-mark generator.

c. Use the Horizontal POSITION control to align the start of the sweep with the 1st vertical graticule line.

d. Set the STORE/NON-STORE switch to STORE (button in).

e. Set the X10 Magnifier knob to On (knob out).

f. CHECK — The time markers are one division apart.

☐ Step 6: Check 4K to 1K Display Compress

a. Set:

   SEC/DIV 50 μs
   X10 Magnifier Off (knob in)
   1K/4K 4K

b. Select 0.1 ms time markers from the time-mark generator and check that the time markers are two divisions apart.

c. Rotate the SEC/DIV Variable control out of detent.

d. CHECK — For two time markers per division over the center eight divisions.

☐ Step 7: Check Non-Store Sweep Length

a. Set:

   SEC/DIV Variable CAL detent
   STORE/NON-STORE NON-STORE (button out).

b. Use the Horizontal POSITION control to align the start of the sweep with the 1st vertical graticule line.

c. CHECK — End of the sweep is to the right of the 11th vertical graticule line.

d. Disconnect the test equipment from the instrument.

☐ Step 8: Check X Gain

a. Set:

   X-Y On (button in)
   CH 1 VOLTS/DIV 10 mV
   Horizontal POSITION Midrange

b. Connect the standard-amplitude signal from the Calibration Generator via a 50 Ω cable to the CH 1 or X input connector.

c. Set the generator to produce a 50 mV signal.

d. Use the CH 2 POSITION and Horizontal POSITION controls to center the display.

e. CHECK — Display is 4.85 to 5.15 horizontal divisions.
f. Disconnect the test equipment from the instrument.

☐ Step 9: Check X Bandwidth

a. Connect the leveled sine wave generator output via a 50 Ω cable and a 50 Ω termination to the CH 1 OR X input connector.

b. Set the generator to produce a five division horizontal display at an output frequency of 50 kHz.

c. Increase the generator output frequency to 2.5 MHz.

d. CHECK — Display is at least 3.5 horizontal divisions.

e. Disconnect the test equipment from the instrument.

Trigger System Checks

Equipment Required (see Table A-7):

- Calibration Generator
- Leveled Sine Wave Generator
- Low Frequency Generator
- 50 Ω BNC Cable
- Dual-Input Coupler
- 50 Ω BNC Termination
- 600 Ω BNC Termination
- 10X Attenuator

Initial Control Settings:

Vertical (Both Channels)

- POSITION (both)
- MODE
- X-Y
- BW LIMIT
- CH 1 VOLTS/DIV
- CH 2 VOLTS/DIV
- Variable (both)
- INVERT
- AC-GND-DC (both)

- Midrange
- CH 1
- Off (button out)
- Off (button out)
- 5 mV
- 50 mV VOLTS/DIV
- CAL detent
- Off (button out)
- DC

Horizontal

- POSITION
- SEC/DIV
- SEC/DIV Variable
- X10 Magnifier
- LEVEL

- Midrange
- 0.2 μs
- CAL detent
- Off (knob in)
- Midrange

Trigger

- SOURCE

- CH 1

Storage

- STORE/NON-STORE

- NON-STORE
- (button out)
Procedure Steps:

☐ Step 1: Check Internal Triggering

a. Connect the leveled sine wave generator output via a 50 Ω cable and a 50 Ω termination to the CH 1 OR X input connector.

b. Set the generator to produce a 10 MHz, 3.5 division display.

c. Set the CH 1 VOLTS/DIV switch to 50 mV.

d. CHECK — Stable display can be obtained by adjusting the Trigger LEVEL control for each switch combination given in Table A-12.

Table A-12: Switch Combinations for Triggering Checks

<table>
<thead>
<tr>
<th>Trigger Mode</th>
<th>Trigger SLOPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORM</td>
<td>Positive</td>
</tr>
<tr>
<td>NORM</td>
<td>Negative</td>
</tr>
<tr>
<td>P-P AUTO</td>
<td>Negative</td>
</tr>
<tr>
<td>P-P AUTO</td>
<td>Positive</td>
</tr>
</tbody>
</table>

- Set:
  - Vertical MODE
  - SOURCE
  - CH 2
  - CH 2

- Move the cable from the CH 1 OR X input connector to the CH 2 OR Y input connector.

- Repeat part d.

- Set:
  - SEC/DIV
  - X10 Magnifier
  - 0.1 μs
  - On (knob out)

- Set the generator to produce a 60 MHz, 1.0 division display.

- Repeat part d.

- Set:
  - Vertical MODE
  - SOURCE
  - CH 1
  - CH 1

- Move the cable from the CH 2 OR Y input connector to the CH 1 OR X input connector.

- Repeat part d.

- Set:
  - SEC/DIV
  - 0.05 μs

- Set the generator to produce a 100 MHz, 1.5 division display.

- Repeat part d.
q. Set:
   Vertical MODE
   SOURCE
   CH 2
   CH 2

r. Move the cable from the CH 1 OR X input connector to the CH 2 OR Y input connector.

s. Repeat part d.

t. Disconnect the test equipment from the instrument.

☐ Step 2: Check HF Reject Triggering

a. Set:
   Vertical MODE
   CH 1
   VOLTS/DIV (both)
   50 mV
   SEC/DIV
   5 μs
   X10 Magnifier
   Off (knob in)
   Trigger Mode
   NORM
   Trigger LEVEL
   Midrange
   SOURCE
   CH 1

b. Connect the low frequency generator output via a 50 Ω cable and a 600 Ω termination to the CH 1 OR X input connector.

c. Set the low frequency generator output to produce a 250 kHz, one division display.

d. Adjust the Trigger LEVEL control for a stable display.

e. Set the COUPL switch to HF REJ position.

f. CHECK — Stable display cannot be obtained by adjusting the Trigger LEVEL control for each switch combination given in Table A-12 on page A-44.

☐ Step 3: Check LF Reject Triggering

a. Set:
   Trigger LEVEL
   Midrange
   COUPL
   NORM

b. Set the generator to produce a 25 kHz, 0.35 division display.

c. Set the COUPL switch to LF REJ position.

d. CHECK — The display cannot be obtained by adjusting the Trigger LEVEL control.

e. Set the generator to produce a 50 kHz, 0.35 division display.

f. CHECK — Stable display can be obtained by adjusting the Trigger LEVEL control.

g. Disconnect the test equipment from the instrument.
Step 4: Check External Triggering

a. Set:
   CH 1 VOLTS/DIV 5 mV
   SEC/DIV 0.1 μs
   SOURCE EXT
   COUPL NORM

b. Connect the leveled sine wave generator output via a 50 Ω cable, a 50 Ω termination, and a dual-input coupler to both the CH 1 OR X and EXT INPUT connectors.

c. Set the leveled sine wave generator output voltage to 40 mV and the frequency to 10 MHz.

d. CHECK — Stable display can be obtained by adjusting the Trigger LEVEL control for each switch combination given in Table A-12 on page A-44.

e. Set:
   CH 1 VOLTS/DIV 50 mV
   X10 Magnifier On (knob out)

f. Set the generator output voltage to 120 mV and the frequency to 60 MHz.

g. Repeat part d.

h. Set the generator output voltage to 150 mV and the frequency to 100 MHz.

i. Repeat part d.

Step 5: Check External Trigger Ranges

a. Set:
   CH 1 VOLTS/DIV 0.5 V
   SEC/DIV 20 μs
   X10 Magnifier Off (knob in)

   Trigger SLOPE Positive (button out)

   Trigger Mode NORM

b. Set the generator to produce a 50 kHz, 6.4 division display.

c. CHECK — Display is triggered along the entire positive slope of the waveform as the Trigger LEVEL control is rotated.

d. CHECK — Display is not triggered (no trace) at either extreme of rotation.

e. Set the Trigger SLOPE button to Negative (button in).

f. CHECK — Display is triggered along the entire negative slope of the waveform as the Trigger LEVEL control is rotated.
g. CHECK — Display is not triggered (no trace) at either extreme of rotation.

☐ Step 6: Check Single Sweep Operation

a. Adjust the Trigger LEVEL control to obtain a stable display.

b. Set:
   CH 1 AC-GND-DC
   Trigger SLOPE
   SOURCE
   COUPL
   SEC/DIV
   GND
   Positive (button out)
   CH 1
   NORM
   20 ms

c. Press in the SQL SWP button. The READY LED should illuminate and remain on.

d. Set the CH 1 AC-GND-DC switch to DC.

NOTE

The INTENSITY control may require adjustment to observe the single-sweep trace.

e. CHECK — READY LED goes out and a single sweep occurs.

f. Press in the SGL SWP button several times.

g. CHECK — Single-sweep trace occurs, and the READY LED illuminates briefly every time the SGL SWP button is pressed in and released.

h. Disconnect the test equipment from the instrument.

☐ Step 7: Check Acquisition Window Trigger Points

a. Set:
   CH 1 AC-GND-DC
   Trigger Mode
   SEC/DIV
   STORE/NON-STOREx
   Acquisision 1K/4K
   GND
   P-P AUTO
   0.1 µs
   STORE
   (button in)
   1k

b. Use the Horizontal POSITION control to align the start of the display acquisition with the 1st vertical graticule line.

c. Press in the Acquisition TRIG POS button until the store trigger point (T) is located on the left side of the screen.

d. CHECK — The POST TRIG point (T) is 1.28 divisions from the start of the display acquisition.
e. Press the **TRIG POS** button a second time to position the trigger point to the middle of the display acquisition.

f. **CHECK** — The MIdTRIG point (T) is 5.12 divisions from the start of the display acquisition.

g. Press the **TRIG POS** button a third time to position the trigger point to the right of the display acquisition.

h. **CHECK** — The PRETRIG point (T) is 8.96 divisions from the start of the display acquisition.

☐ **Step 8: Check Trigger Level Readout**

a. Set:
   - Vertical **MODE**
   - **CH 1 VOLTS/DIV**
   - **CH 1 AC-GND-DC**
   - **SEC/DIV**
   - **Trigger Mode**
   - **Trigger LEVEL**
   - **Trigger SOURCE**
   - **STORE/NON-STORE**

   CH 1
   - 20 mV
   - GND
   - 0.5 ms
   - **P-P AUTO**
   - Midrange
   - **Vertical MODE**
   - **NON-STORE**
   - (button out)

b. Center the trace on the screen.

c. **CHECK** — The trigger readout is between −6 mV and +6 mV.

d. Connect the standard-amplitude signal from the calibration generator via a 50 Ω cable to the CH1 or × input connector.

e. Set:
   - **CH 1 AC-GND-DC**
   - **Trigger Mode**

   DC
   - **NORM**

f. Set the generator to produce a five division standard-amplitude signal.

g. Adjust the Trigger **LEVEL** control for a stable display and center the waveform on the screen.

h. Set the **CH 1 VOLTS/DIV** switch to 10 mV for a 10 division display.

i. Vertically position the top of the waveform display on the center horizontal graticule line.

j. Set the Trigger **SLOPE** switch to Negative (button in).

k. Rotate the Trigger **LEVEL** control clockwise until the triggering of the waveform display becomes unstable.

l. **CHECK** — That the trigger readout is between 92 mV and 108 mV.

m. Repeat procedure for CH 2 using the CH 2 controls.

n. Disconnect the test equipment from the instrument.
External Z-Axis, Probe Adjust, External Clock, and X-Y Plotter Checks

Equipment Required (see Table A-26):
- Leveled Sine Wave Generator
- BNC T-Connector
- Pulse Generator
- Digital Voltmeter
- 10X Probe (provided with instrument)
  - Two 50 Ω BNC Cables
  - 50 Ω BNC Termination
  - BNC male-to-tip plug

Initial Control Settings:

**Vertical (Both Channels)**
- CH 1 POSITION
- MODE
- X-Y
- BW LIMIT
- CH 1 VOLTS/DIV
- CH 1 VOLTS/DIV Variable
- CH 1 AC-GND-DC
  - Midrange
  - CH 1
  - Off (button out)
  - Off (button out)
  - 1 V
  - CAL detent
  - DC

**Horizontal**
- POSITION
- SEC/DIV
- SEC/DIV Variable
- X10 Magnifier
  - Midrange
  - 20 μs
  - CAL detent
  - Off (knob in)

**Trigger**
- VAR HOLDOFF
  - Mode
  - SLOPE
  - LEVEL
  - SOURCE
  - COUPL
  - EXT COUPL
  - NORM
  - P-P AUTO
  - Positive
  - (button out)
  - Midrange
  - Vertical MODE
  - NORM
  - AC

**Storage**
- STORE/NON-STORE
  - NON-STORE
  - (button out)

Procedure Steps:

☐ Step 1: Check External Z-Axis Operation

a. Connect the leveled sine wave generator output via a 50 Ω cable and a T-connector to the CH 1 OR X input connector. Then connect a 50 Ω cable and a 50 Ω termination from the T-connector to the EXT Z-AXIS INPUT connector on the rear panel.

b. Set the generator to produce a 5 V, 50 kHz signal.

c. CHECK — For noticeable intensity modulation. The positive part of the sine wave should be of lower intensity than the negative part.
d. Disconnect the test equipment from the instrument.

**Step 2: Check Probe Adjust Operation**

a. Connect the 10X Probe to the CH 1 OR X input connector and insert the probe tip into the PRB ADJ (Probe Adjust) jack on the instrument front panel. If necessary, adjust the probe compensation for a flat-topped square-wave display.

b. CHECK — Display amplitude is 4.75 to 5.25 divisions.

c. Disconnect the probe from the instrument.

**Step 3: Check External Clock**

a. Set:

   - CH 1 VOLTS/DIV
   - SEC/DIV
   - 1 V
   - 1 ms

b. Connect the Pulse Generator high amplitude output via a 50 Ω cable and a 50 Ω termination to CH 1 OR X input connector.

c. Set the generator to produce a 10 μs square wave, with a pulse duration of 5 μs. Set the amplitude for a five division display, with a base (bottom) of 0 volts and a top of 5 volts (TTL levels).

d. Disconnect the cable from the CH 1 OR X input connector and connect it to the BNC male-to-tip plug via BNC female to BNC female connector.

e. Insert the BNC male-to-tip plug signal lead and ground lead into pin 1 (EXT CLOCK) and pin 6 (SIG GND) respectively of the X-Y Plotter connector.

f. Set the SEC/DIV switch to 0.1 sec.

g. Connect the Calibration Generator high amplitude output via a 50 Ω cable and a 50 Ω termination to CH 1 OR X input connector.

h. Set the generator to produce a 100 Hz, five division display.

i. Set:

   - SEC/DIV
   - STORE/NON-STORE
   - EXT CLK
   - STORE (button in)

j. Press the Setup ACQ button to display the ACQUISITION menu and select Fast with the Ext Clock button. Return the instrument to display mode by pressing the Setup ACQ button a second time.

k. CHECK — The 100 Hz signal is displayed on the screen and updated.

l. Press in the SAVE/CONT button to select SAVE.

m. CHECK — The display is save.

n. Press in the SAVE/CONT button to select CONT.

o. Disconnect the test equipment from the instrument.
Step 4: Check X-Y Plotter

a. Set the SEC/DIV switch to 10 ms.

b. Connect the digital voltmeter low lead to either chassis ground or pin 7 (signal ground) of the X-Y Plotter connector. Connect the volts lead to pin 3 (X Output) of the X-Y Plotter connector.

c. Set the digital voltmeter to the 20 V scale.

d. Press the Setup PLOT button to display the PLOT menu. Set Plotter Type to XY, Grat to ON, and Auto Plot to OFF. Use the CURSORS knob to set Plot Speed to 10.

e. Press in the Start button to activate the X-Y Plotter.

NOTE

Voltage reading of the X Output will be negative left of the center vertical graticule line and positive to the right of the center vertical graticule line. Voltage reading of the Y output will be negative below the center horizontal graticule line and positive above the center horizontal graticule line.

f. Record the voltage reading as the instrument plots the 1st and the 10th graticule line (as the intensity spot moves along the graticule line).

g. CHECK — The voltage difference between the 1st and 10th graticule line is between 4.0 V and 6.0 V.

h. Move the volts lead of the voltmeter from pin 3 (X Output) to pin 5 (Y Output) to the X-Y Plotter connector.

i. Press the Start button in again to activate the X-Y Plotter.

j. Record the voltage reading as the instrument plots the top and the bottom of the graticule lines (as the intensity spot moves along the graticule line).

k. CHECK — The voltage difference between the top and bottom graticule line is between 3.2 V and 4.8 V.

l. Disconnect the test equipment from the instrument.
Appendix D: Storage Modes

The SEC/DIV and trigger mode settings determine the storage mode and corresponding set of available acquisition modes.

**Table A-13: Storage Modes**

\(^1\)The default modes for Acquisition and Auto Vectors are in bold face.
\(^2\)In X-Y mode, Auto Vectors are turned off.
\(^3\)External clock speed range is selected in the ACQUISITION menu.
\(^4\)Scan is selected in the ACQUISITION menu.
\(^5\)Roll is selected in the ACQUISITION menu.
\(^6\)Storage mode is Triggered Scan if ACCPEAK or AVERAGE Acquisition mode is selected.
Glossary

Accumulate peak acquisition mode
A mode in which the oscilloscope acquires and displays a waveform that shows the variation extremes of several acquisitions.

Accuracy
The closeness of the indicated value to the true value.

Acquisition
The process of sampling signals from input channels, digitizing the samples into data points, and assembling the data points into a waveform record. The waveform record is stored in memory. The trigger marks time zero in that process.

Acquisition interval
The time duration of the waveform record divided by the record length. The oscilloscope displays one data point for every acquisition interval.

AC signal
The time-variant portion of voltage or current.

Active cursor
The cursor that moves when you turn the cursor knob. It is indicated in the display by a cursor with a box around it.

Aliasing
A false representation of a signal due to insufficient sampling of high frequencies or fast transitions. A condition that occurs when an oscilloscope digitizes at an effective sampling rate that is too slow to reproduce the input signal. The waveform displayed on the oscilloscope may have a lower frequency than the actual input signal.

Alternate (vertical)
A vertical mode of operation for a dual-trace oscilloscope. The oscilloscope makes a complete sweep of first one channel and then the other. This mode is generally used for SEC/DIV settings of less (or faster) than 1 ms/div.

Alternating Current (AC)
An electric current whose instantaneous value and direction change periodically.

Amplitude
The difference between a high and a low point on a waveform. Signal amplitude can be measured in terms of “peak-to-peak” or “peak” for example.

Attenuation
The degree the amplitude of a signal is reduced when it passes through an attenuating device such as a probe or attenuator. That is, the ratio of the input measure to the output measure. For example, a 10X probe will attenuate, or reduce, the input voltage of a signal by a factor of 10.
Automatic trigger mode (P-P AUTO)
A trigger mode that causes the oscilloscope to automatically acquire or
sweep if triggerable events are not detected within a specified time
period.

Bandwidth
For an oscilloscope, bandwidth is the specified frequency range of the
vertical system wherein the vertical response is greater than or equal to
0.707 (−3 db) of the specified frequency down to DC or 0 Hz.

Bezel
The frame around the CRT that holds the implosion shield in place.

Bezel Buttons
The buttons on the bezel that are used to store waveforms or make
menu selections.

Cathode-ray tube (CRT)
An electron-beam tube in which the beam can be focused to a small
cross section on a luminescent screen and varied in both position and
intensity to produce a visible pattern.

Chop
A vertical mode of operation for dual-trace oscilloscopes in which the
display is switched or sampled between the channels at some fixed rate.
Chop is generally used at sweep speeds slower than 0.5 ms/div.

CRT
An acronym for the display device of the oscilloscope: Cathode-Ray
Tube.

Compensation
In relation to oscilloscope probes, compensation is the act of adjusting
the resistive and capacitive components of the probe to offset undesir-
able characteristics of both the probe and the input channel. Probe
compensation ensures fidelity of the input signal.

Coupling
The method of connecting the input circuit to the signal source. A cou-
pling circuit, for example, may pass only AC signals above a certain
frequency or it may attenuate the signal by some designated factor.

Cursors
Paired markers that you can use to make measurements between two
waveform locations. The oscilloscope displays the values (expressed in
volts or time) of the difference between the two cursors.

Delay measurement
The difference in time between two points using a dual time base instru-
ment.

Detent
A mechanical setting or switch position typified by a gradual increase in
force to a position at which there is an immediate and marked reduction in
force.
Digitizing
The process of converting a continuous analog signal such as a wave-
form to a set of discrete numbers representing the amplitude of the
signal at specific points in time. Digitizing is composed of two steps:
sampling and quantizing.

Direct current (DC)
An electric current that flows in only one direction with essentially
constant value.

Display system
The part of the oscilloscope that shows waveforms, measurements,
menu items, status, and other parameters.

Display menu
The setup menu on the 2221A Digital Storage Oscilloscope that allows
the user to select the type of cursor time readout, digital smoothing, or
data-point vectors.

Fall time
A measurement of the time it takes for trailing edge of a pulse to fall from
90% to 10% of its amplitude.

Frequency
A timing measurement that is the reciprocal of the period. Measured in
Hertz (Hz) where 1 Hz = 1 cycle per second.

Ground
A connection or reference to the zero voltage potential of earth ground.

GPIB (General Purpose Interface Bus)
An interconnection bus and protocol that allows you to connect multiple
instruments in a network under the control of a controller. Also known as
IEEE 488 bus. It transfers data with eight parallel data lines, five control
lines, and three handshake lines.

Griticule
A grid on the display screen that creates the horizontal and vertical axes.
You can use it to visually measure waveform parameters.

Hardcopy
An electronic copy of the display in a format useable by a printer or
plotter.

Hertz
The unit of frequency, one cycle per second.

Holdoff, trigger
A specified amount of time after a trigger signal that elapses before the
trigger circuit will accept another trigger signal. Holdoff helps to stabilize
the display of a signal that is otherwise difficult to trigger.

Intensity
Display brightness.

Knob
A rotary control.
Megahertz (MHz)
A frequency of one million Hz (cycles per second), or $10^6 \text{ Hz}$.

Megasample per second (Ms/s)
One million ($10^6$) samples per second.

Noise
An unwanted voltage or current in an electrical signal.

Oscilloscope
An instrument for making a graph of two factors. These are typically voltage versus time.

Peak
The difference in amplitude between the maximum value and the average or mean value of a waveform.

Peak-to-Peak
Amplitude measurement of the absolute difference between the maximum and minimum amplitude.

Period
A timing measurement of the time covered by one complete signal cycle. It is the reciprocal of frequency and is measured in seconds.

Phase
A timing measurement between two waveforms of the amount one leads or lags the other in time. Phase is expressed in degrees, where $360^{\circ}$ comprises one complete cycle of one of the waveforms. Waveforms measured should be of the same frequency or one waveform should be a harmonic of the other.

Probe
An oscilloscope input device.

Quantizing
The process of converting an analog input that has been sampled, such as a voltage, to a digital value.

Record length
The specified number of samples in a waveform.

Reference memory
Memory in an oscilloscope used to store waveforms or settings. The digital storage oscilloscope saves the data even when the oscilloscope is turned off or unplugged.

Repetitive acquisition
The particular mode on the instrument at the faster sweep speeds where numerous acquisitions are required to form a picture of the waveform because of the limits imposed by the sampling rate.

Repetitive signal
A signal that varies uniformly in terms of voltage over time.
Rise time
The time it takes for a leading edge of a pulse to rise from 10% to 90% of its amplitude.

Roll
A slow-speed storage mode where the acquired data first appears at the right side of the display and forms a record that continues to scroll right to left across the display at a rate set by the time base.

RS-232-C interface
A communications device that conforms to the Electronic Industries Association (EIA) RS-232-C standard for data terminal or data communications equipment.

Sampling
The internal process of the oscilloscope that captures an analog input (such as a voltage) at a discrete point in time and holds it constant until it is quantized. Two general methods of sampling are: real-time sampling and equivalent-time sampling.

Sampling Rate
This is the actual frequency at which the oscilloscope takes a sample. This frequency may be expressed in samples/second or hertz.

Scan
A slow-speed storage mode that updates the acquisition display left to right across the display at a rate determined by the time base setting.

Selected waveform
The waveform on which cursor measurements are performed. The “—” symbol underscores the selected memory location indicated by 1, 2, 3, or 4K. The symbol appears under the letter “A” when the waveform selected is the current acquisition.

Setup (menus)
A group of related controls for major oscilloscope functions that are located on the front panel of the oscilloscope above the intensity control.

Slope
The rising or falling edge of a signal (signal transition) that is selected for triggering the horizontal sweep of the oscilloscope.

Smooth
A digital process that examines the change in value of data points between adjacent intervals and reorders them for correct slope (and a smoother waveform) if the change in value does not exceed a certain limits.

Sweep
Time-dependent information created by the electron beam moving across a CRT screen.

Time base
The set of parameters that let you define the time and horizontal axis attributes of a waveform.
Trace
The visual representation of an individual signal on a CRT.

Trigger
The signal used to initiate a sweep or acquisition on an oscilloscope.

Trigger level
The vertical level the trigger signal must cross to generate a trigger.

Trigger position
The position of the trigger reference point in the acquisition record.

Vector
A line created by the storage mode display system of the oscilloscope that connects two data points.

Waveform
The shape or form (visible representation) of a signal.

X-Y
A display mode that compares the voltage levels of two signals. One signal drives the horizontal or “X” axis and the other signal drives the vertical or “Y” axis. It is useful for studying phase relationships between two waveforms.

Z-Axis
The intensity aspect of an electron-beam (CRT) display. Z-Axis may also refer to the circuitry that controls the CRT beam intensity.
