Tektronix

PS2520G & PS2521G
Programmable Power Supplies

070-9197-00
Tektronix warrants that this product will be free from defects in materials and workmanship for a period of one (1) year from the date of shipment. If any such product proves defective during this warranty period, Tektronix, at its option, either will repair the defective product without charge for parts and labor, or will provide a replacement in exchange for the defective product.

In order to obtain service under this warranty, Customer must notify Tektronix of the defect before the expiration of the warranty period and make suitable arrangements for the performance of service. Customer shall be responsible for packaging and shipping the defective product to the service center designated by Tektronix, with shipping charges prepaid. Tektronix shall pay for the return of the product to Customer if the shipment is to a location within the country in which the Tektronix service center is located. Customer shall be responsible for paying all shipping charges, duties, taxes, and any other charges for products returned to any other locations.

This warranty shall not apply to any defect, failure or damage caused by improper use or improper or inadequate maintenance and care. Tektronix shall not be obligated to furnish service under this warranty a) to repair damage resulting from attempts by personnel other than Tektronix representatives to install, repair or service the product; b) to repair damage resulting from improper use or connection to incompatible equipment; or c) to service a product that has been modified or integrated with other products when the effect of such modification or integration increases the time or difficulty of servicing the product.

THIS WARRANTY IS GIVEN BY TEKTRONIX WITH RESPECT TO THIS PRODUCT IN LIEU OF ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED. TEKTRONIX AND ITS VENDORS DISCLAIM ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. TEKTRONIX’ RESPONSIBILITY TO REPAIR OR REPLACE DEFECTIVE PRODUCTS IS THE SOLE AND EXCLUSIVE REMEDY PROVIDED TO THE CUSTOMER FOR BREACH OF THIS WARRANTY. TEKTRONIX AND ITS VENDORS WILL NOT BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES IRRESPECTIVE OF WHETHER TEKTRONIX OR THE VENDOR HAS ADVANCE NOTICE OF THE POSSIBILITY OF SUCH DAMAGES.

This manual explains how to use and program the PS2520G and PS2521G Programmable Power Supplies over the General Purpose Interface Bus (GPIB). The following sections make up the body of this manual:

- **Getting Started** describes how to set up the power supply and GPIB systems.
- **Syntax and Commands** describes the structure of messages your program sends to the power supply.
- **Status and Events** describes how to use the event messages in your programs.

Refer to the *PS2520, PS2520G, PS2521 & PS2521G User Manual* (070-9196-XX) for product specifications, safety summary, operating and service information, and a list of standard accessories for the programmable power supplies.
Getting Started

With a computer (controller), you can operate the PS2520G and PS2521G Programmable Power Supplies over the GPIB. This section explains how to perform the following tasks:

- Set up GPIB systems
- Connect the programmable power supply to a GPIB controller
- Set GPIB address of the programmable power supply
- Test the GPIB connection

Setting Up the GPIB System

Observe these rules when you set up the programmable power supply with a GPIB system:

- Each device on the bus needs a unique device address. No two devices can share the same device address.
- Do not connect more than 15 devices to any one bus.
- Connect one device for every 2 m (6 ft) of cable used.
- Do not use more than 20 m (65 ft) of cable to connect devices to a bus.
- Turn on at least two-thirds of the devices on the GPIB system while you use the system.
- Configure the devices on the system as shown in Figure 1. Do not use loop or parallel configurations.
Connecting a Controller

You must have a GPIB controller, such as a PC with a GPIB card, to operate the programmable power supplies over the GPIB interface.

Figure 2 on page 3 shows the location of the GPIB port on the rear panel.

Connect the programmable power supply to a GPIB controller as follows:

1. Connect one end of a GPIB cable to the GPIB controller.
2. Connect the other end of the GPIB cable to the GPIB port on the programmable power supply.
3. Turn on the programmable power supply.
4. Turn on the GPIB controller.
Setting the Address

Change the GPIB address of the programmable power supply using the following procedure:

**NOTE.** Each device connected to the same controller must have a unique GPIB address. The factory default address for the PS2520G and PS2521G Programmable Power Supplies is 12.

1. Make sure the AUTO SEQ function is off. (The indicator for AUTO must be off).

2. Press **LOCAL** → (number) → (return →) to enter the GPIB address of the power supply. (The address must be a number between 0 and 30.)
3. To check the address setting of the power supply, press the **LOCAL** button again. The display remains active for about 3 seconds to allow you to view or change the setting.

**Testing the GPIB Connection**

To test whether the GPIB connection is working, send a GPIB query from the computer. For example, the query

*idn?

should return the name of the instrument, SCPI version, and firmware version in the following form:

TEKTRONIX,<model>,0,SCPI:<year> FW<version>

If you do not get a proper response from the programmable power supply, check to make sure the power is on, all cable connections are secure, and the GPIB address is correct.
Syntax and Commands

This section provides an overview of the commands for the PS2520G and PS2521G Programmable Power Supplies. This section includes the following topics:

- A brief introduction to SCPI
- A description of the command syntax
- Instructions on how to enter commands
- A summary of commands by functional group

In addition, the section Command Descriptions on page 19 lists the commands alphabetically and provides a detailed description for each command.

The commands for the programmable power supplies are compatible with IEEE-488.1, IEEE-488.2, and SCPI-1994.0 standards.

SCPI

SCPI (Standard Commands for Programmable Instruments) is a standard created by an international consortium of the major manufacturers of test and measurement equipment. SCPI uses IEEE-488.2 syntax to provide common commands for the identical functions of various programmable instruments.

The standard simplifies the task of programming a group of instruments that use SCPI. Instead of having to learn different commands for every instrument, the programmer may use the same commands for the identical functions of each instrument.

Commands and Queries

The controller sends instructions to the instrument in the form of commands or queries. Commands modify control settings or tell the instrument to perform a specific action. Queries cause the instrument to send data or status information back to the controller. A question mark at the end of a command identifies it as a query.
Different product manuals may also use the terms “program messages” or simply “commands” to refer to commands and queries as a whole. This manual uses the term “commands” to mean any type of instruction from the controller to the programmable instrument.

**Command Syntax**

Any instruction that you send to an instrument that complies with SCPI must have at least three basic elements:

- Command header
- Parameter (if required)
- Message terminator or separator

**Command Header**

The command header has a hierarchical structure that can be represented by a command tree (Figure 3). A mnemonic designates each level of the hierarchy. A colon separates the levels.

The top level of the tree is the root level. A root node is a mnemonic at the root level. A root node and one or more lower-level nodes form a header path to the last node called the leaf node.

![Figure 3: Tree Hierarchy](image)
The header path and leaf node together form the command header. Figure 4 shows the command header for the leaf node indicated in Figure 3.

![Command Header Diagram](image)

**Figure 4: Command Header**

**Parameter**

You must include values for commands that have parameters. In this manual, the `< >` symbols enclose the parameter type when stating the syntax of the command. For example, the syntax of the command in Figure 5 includes the Boolean parameter type.

![Parameter Diagram](image)

**Figure 5: Command Header with Parameter**

Table 1 defines the Boolean and other parameter types for the programmable power supplies.
Table 1: Parameter Types for Syntax Descriptions

<table>
<thead>
<tr>
<th>Parameter Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Boolean numbers or values</td>
<td>ON or 1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>OFF or 0</td>
</tr>
<tr>
<td>NR1</td>
<td>Integers</td>
<td>0, 1, 15</td>
</tr>
<tr>
<td>NR2</td>
<td>Decimal numbers</td>
<td>1.2, 3.141516, 6.5</td>
</tr>
<tr>
<td>NR3</td>
<td>Floating point numbers</td>
<td>3.1E–1, 2.01E+1</td>
</tr>
<tr>
<td>NRf</td>
<td>NR1, NR2, or NR3</td>
<td>1, 1.2, 3.1E–1</td>
</tr>
<tr>
<td>string</td>
<td>Alphanumeric characters (must be within quotation marks)</td>
<td>“No error”</td>
</tr>
<tr>
<td>MAXimum</td>
<td>MINimum</td>
<td>Special mnemonics for setting the parameter to the largest or smallest value the instrument allows.</td>
</tr>
</tbody>
</table>

For the actual value of the parameter type <Boolean>, you may enter 0 or OFF or you may enter 1 or ON.

For the command in Figure 5, entering 0 or OFF turns the overcurrent protection (OCP) off and entering 1 or ON turns the OCP on.

The following example includes both the header and a value for the parameter type:

SOURce:CURRent:PROTection:STATe OFF

Parameter values that appear in this manual are often separated by a vertical line. This vertical line means the same thing as the word “or.” For example, values for the parameter <Boolean> are

0 | 1 | OFF | ON

This is the same thing as saying “0 or 1 or OFF or ON.” Any single value is a valid parameter.

NOTE: Do not include the <, >, or | symbols when entering the actual value for a parameter.
Message Terminator and Message Separator

In accordance with IEEE 488.2-1992, the accept any of the following message terminators:

- LF^END Line feed code (hexadecimal 0A) with END message
- LF Line feed code
- <dab>^END Last data byte with END message

These terminators are compatible with most controller application programs.

A semicolon separates one command from another when the commands appear on the same line.

Entering Commands

The standards that govern the command set for the programmable power supplies allow for a certain amount of flexibility when you enter commands. For example, you can abbreviate many commands or combine commands into one message that you send to the programmable power supply. This flexibility, called friendly listening, saves programming time and makes the command set easier to remember and use.

Command Characters

The programmable power supplies are not sensitive to the case of command characters. You can enter commands in either uppercase or lowercase.

You can precede any command with white space characters. White space characters include a space or any combination of the ASCII control characters hexadecimal 00 through 1F except for the character 0A (line feed). You must, however, use at least one space between the parameter and the command header.
Abbreviating Commands

Most commands have a long form and a short form. The listing for each command in this section shows the abbreviations in upper case. For example, you can enter the query SOURce:VOLTage? simply as SOUR:VOLT? (or sour:volt?).

The brackets around a mnemonic indicate that the programmable power supply assumes this level of the command header by default. It is not necessary, therefore, for this mnemonic to appear as part of the header when you send the command. For example, you can abbreviate the command

[SOURce:]VOLTage[:LEVEL][:IMMediate][AMPLitude] 10

to

volt 10

Because the programmable power supply assumes that a command starts from the root, you have the option of beginning the initial command header with a colon (:).

Combining Commands

You can combine (concatenate) commands and queries using a semicolon (;). The programmable power supply executes concatenated commands in the order it receives them. When you concatenate queries, the programmable power supply combines the responses into a single response message. For example, if the current and voltage limits are set to 1 A and 20 V, the command

curr?;volt?

returns the message

0.100E+1;0.200E+2

If the command that follows the semicolon has a different header path from the root level, you must use a colon to force a return to the root level:

MEASure:CURRent?;OUTPut:STATe?

If the command that follows the semicolon has the same header path, you may omit the colon and the path and state only the new leaf
node. This makes it possible, for example, to shorten the concatenated query

`:MEASure:CURRent?; :MEASure:VOLTage?`

into

`MEASure:CURRent?; VOLTage?`

You can combine commands and queries into the same message. Note, for example, the following combination:

`sour:volt 10; :sour:volt?`

or

`sour:volt 10; volt?`
Summary of Commands

The tables in this section summarize the command set of the programmable power supplies. These tables divide the commands into the following functional groups:

- General Setting Commands
- Status Commands
- Miscellaneous Commands

The tables also provide a brief description of each command.

General Setting Commands

Table 2 lists the general setting commands that control and query the settings of the power supply. To a large extent, the commands duplicate the function of the front panel controls and indicators.

### Table 2: General Setting Commands

</table>

1 Not a SCPI standardized command.
Command Descriptions

This section provides an alphabetical listing and a detailed description of each command. It also provides examples of each command and what the query form might return.

*CLS (No Query Form)

Clears the following status data structures:
- Standard Event Status Register
- Operation Event Status Register
- Questionable Event Status Registers
- Error/Event Queue

Syntax

*CLS

Examples

*CLS clears all event registers.

*ESE

Sets or returns the bits in the Event Status Enable Register (ESER). The ESER enables the Standard Event Status Register (SESR) to be summarized on bit 5 (ESB) of the Status Byte Register (SBR). Refer to Figure 12 on page 52 for an illustration of the ESER.

Syntax

*ESE  <NRf>
*ESE?

Parameters

<NR1> is a number from 0 to 255. The binary bits of the ESER are set according to this value.
Returns

<i>NR1</i> is a number from 0 to 255 that indicates the decimal value of the binary bits of the ESER.

Examples

*ESE  48  sets the ESER to binary 0011 0000, which enables the CME and EXE bits.

*ESE? returns 129 if the ESER contains the binary value 1000 0001.

*ESR? (Query Only)

Returns and clears the contents of the Standard Event Status Register (SESR). Refer to Figure 11 on page 50 for an illustration of the SESR.

Syntax

*ESR?

Returns

<i>NR1</i> is a number from 0 to 255 that indicates the decimal value of the binary bits of the SESR.

Examples

*ESR? returns 160, if the SESR contains binary 1010 0000 (PON and CME bits set).

*IDN? (Query Only)

Returns the unique identification code of the power supply.

Syntax

*IDN?

Examples

*IDN? returns

TEKTRONIX,PS2521G,0,SCPI:94.0 FW:.10
**INSTrument:NSELect**

Selects Output 1, Output 2, or Output3. Only one output may be selected at a time for configuration.

**Syntax**

```
INSTrument:NSELect <NR1>
INSTrument:NSELect?
```

**Parameters**

```
1|2|3
```

**Returns**

```
1|2|3
```

**Examples**

- `INSTrument:NSELect 2` selects Output 2.
- `INSTrument:NSELect?` returns 3 if Output 3 is selected.

**INSTrument[:SELect]**

Selects Output 1, Output 2, or Output3. An output must be selected before it can be configured and only one output may be selected at a time.

**Syntax**

```
INSTrument[:SELect] <identifier>
INSTrument[:SELect]?
```

**Parameters**

```
OUT1|OUT2|OUT3
```

**Returns**

```
OUT1|OUT2|OUT3
```

**Examples**

- `INSTrument[:SELect] OUT1` selects Output 1.
- `INSTrument[:SELect]?` returns OUT2 if Output 2 is selected.
**INSTrument:COUPle:TRACking**

Selects independent, parallel-tracking, or series-tracking mode.

**Syntax**

```plaintext
INSTrument:COUPle:TRACking <identifier>
INSTrument:COUPle:TRACking?
```

**Parameters**

- NONE
- PARallel
- SERies

NONE is independent mode
PARallel is parallel-tracking mode
SERies is series-tracking mode

**Returns**

- NONE
- PARallel
- SERies

**Examples**

INSTrument:COUPle:TRACking NONE selects the independent mode.
INSTrument:COUPle:TRACking? returns SERies if series-tracking mode is selected.

**MEASure[:SCALar]:CURRent[:DC]? (Query Only)**

Returns actual output current.

**Syntax**

```plaintext
MEASure[:SCALar]:CURRent[:DC]?
```

**Returns**

- `<NR3>`

**Examples**

MEASure:CURRent? might return 0.8E-2 to indicate that the load is drawing 0.008 A (8 mA).
MEASure[:SCALar]:VOLTage[:DC]? (Query Only)

Returns actual output voltage or sense input voltage.

Syntax

MEASure[:SCALar]:VOLTage[:DC]?

Returns

<NR3>

Examples

MEASure:VOLTage? might return 0.367E+1 to indicate the voltage at the output is 3.67 V.

*OPC

The command form (*OPC) sets the operation complete bit (bit 0) in the Standard Event Status Register (SESR) when all pending operations finish.

The query form (*OPC?) tells the programmable power supply to place an ASCII 1 in the Output Queue when the power supply completes all pending operations.

Syntax

*OPC
*OPC?

Returns

1

OUTPut:PROTection:CLEar (No Query Form)

Resets (clears) the Overvoltage Protection. This command duplicates the function of the OVP RESET button.

Syntax

OUTPut:PROTection:CLEar
OUTPut[:STATe]

Enables or disables the output of the power supply. ON (enabled) is signified by a 1 and OFF (disabled) by a 0. The query form returns a 1 if the output is on and a 0 if the output is off.

Syntax

OUTPut:STATe <Boolean>
OUTPut:STATe?

Parameters

0|1|OFF|ON

Returns

0|1

Examples

OUTPut:STATe  ON enables the power supply output.
OUTPut:STATe? returns 1 if the power supply output is enabled.

*RST (No Query Form)

Resets the control settings of the programmable power supply to a set of known states but does not purge stored settings. Refer to Table 5 for the reset state of the control settings.

Table 5: State of Control Settings after *RST

<table>
<thead>
<tr>
<th>Front Panel Control</th>

<tr>
<td>SERIES/INDEP PARA/INDEP</td>
<td>INSTrument:COUPle:TRACking</td>
<td>NONE</td>
</tr>
</tbody>
</table>

**Syntax**

*SRT*

**[SOURce:]CURRent[:LEVel][:IMMediate][:AMPLitude]**

Sets the current limit. The query form returns the current limit setting.

**Syntax**

```
[SOURce:]CURRent[:LEVel][:IMMediate][:AMPLitude] <NRf> [MAXimum|MINimum]
```

```
[SOURce:]CURRent[:LEVel][:IMMediate][:AMPLitude]?
```

**Parameters**

On the PS2520G, \(<\text{NRf}\)> ranges from 0 to 1.500 (amps) for Output 1 and Output 2 and 0 to 3.000 (amps) for Output 3.
On the PS2521G <NRf> ranges from 0 to 2.500 (amps) for Output 1 and Output 2 and 0 to 5.000 (amps) for Output 3.

Returns

<NR3>

Examples

SOURce:CURRent 1.5 sets the current limit to 1.5 amps.

SOURce:CURRent? returns 0.1000E+1 if the current limit setting is 1 amp.

[SOURce:]CURRent:PROTect:STATe

Sets the overcurrent protection on or off. The query form returns the state of the overcurrent protection as either on or off.

Syntax

[SOURce:]CURRent:PROTect:STATe <Boolean>

[SOURce:]CURRent:PROTect:STATe?

Parameters

0|1|OFF|ON
OFF or 0 sets overcurrent protection off. ON or 1 sets overcurrent protection on.

Returns

0|1

Examples

SOURce:CURRent:PROTect:STATe OFF sets the overcurrent protection off.

SOURce:CURRent:PROTect:STATe? returns 1 if the overcurrent protection is on.
[SOURce:]VOLTage[:LEVEL][:IMMediate][:AMPLitude]

Sets the voltage limit of the power supply. The query form returns the voltage limit setting.

Syntax

[SOURce:]VOLTage <NRf>|MAXimum|MINimum
[SOURce:]VOLTage?

Parameters

On the PS2520G, <NRf> is a positive integer or real number from 0 to 37.00 volts for Output 1 and Output 2 and 0 to 6.50 volts for Output 3.

On the PS2521G, <NRf> is a positive integer or real number from 0 to 21.00 volts for Output 1 and Output 2 and 0 to 6.50 volts for Output 3.

Returns

<NR3>

Examples

SOURce:VOLTage 3.5 sets the voltage limit to 3.5 volts.

SOURce:VOLTage? returns 0.200E+1 if the voltage limit setting is 2 volts.

[SOURce:]VOLTage:PROTection[:LEVEL]

Sets the overvoltage protection level. The query form returns the present setting of the overvoltage protection circuit.

Syntax

[SOURce:]VOLTage:PROTection[:LEVEL] <NRf>|MAXimum|MINimum
[SOURce:]VOLTage:PROTection[:LEVEL]?
Parameters

On the PS2520G, <NRf> ranges from 0 to 38.50 volts for Output 1 and Output 2 and 0 to 7.00 volts for Output 3.

On the PS2521G, <NRf> ranges from 0 to 22.50 volts for Output 1 and Output 2 and 0 to 7.00 volts for Output 3.

Returns

<NR3>

Examples

VOLTage:PROTection 24.5 sets the overvoltage protection to 24.5 volts.

VOLTage? returns 0.3100E+2 if the overvoltage protection setting is 31 volts.

*SRE

Sets the contents of the Service Request Enable Register (SRER). The query form returns the contents of the SRER. Bit 6 of the SRER is always zero. The bits on the SRER correspond to the bits on the SBR. Refer to Table 9 on page 50 for an explanation of each bit in the SBR. Refer to page 52 for additional information about enable registers.

Syntax

*SRE  <NRf>
*SRE?

Parameters

<NRf> is an integer from 0 to 255.

Returns

<NR1>

Examples

*SRE  8 sets bits of the SRER to 0000 1000.

*SRE? returns 2 if the SRER is set to 0000 0010.
STATus:OPERation:CONDition? (Query Only)

Returns the contents of the OPERation register. The PS2520G and PS2521G Programmable Power Supplies, however, do not use the OPERation register to report any conditions.

Reading the OPERation register does not affect its contents.

Syntax

STATus:OPERation:CONDition?

Returns

<NR1>

Examples

STATus:OPERation:CONDition? returns 0.

STATus:OPERation:ENABle

Sets or returns the contents of the OPERation Enable Register. Even though this is a 16-bit register, only 15 bits (bit 0 through bit 14) are used. Bit 15 is always 0.

Syntax

STATus:OPERation:ENABle <NR1>
STATus:OPERation:ENABle?

Parameters

<NR1> is an integer from 0 to 32767.

Returns

<NR1>

Examples

STATus:OPERation:ENABle 32767 sets all 15 bits of the register high.

STATus:OPERation:ENABle? returns 0 if all 15 bits of the register are low.
STATus:OPERation[:EVENt]?

Returns and clears the contents of the OPERation register. The response is a decimal value that summarizes the binary values of the set bits.

Syntax

```
STATus:OPERation[:EVENt]?
```

Returns

```
<NR1>
```

Examples

```
STATus:OPERation:EVENt? returns 0.
```

STATus:OPERation:INSTrument:CONDition? (Query Only)

Returns the contents of the OPERation INSTrument register. The PS2520G and PS2521G Programmable Power Supplies, however, do not use the OPERation INSTrument register to report any conditions.

Reading the OPERation INSTrument register does not affect its contents.

Syntax

```
STATus:OPERation:INSTrument:CONDition?
```

Returns

```
<NR1>
```

Examples

```
STATus:OPERation:INSTrument:CONDition? returns 0.
```

STATus:OPERation:INSTrument:ENABle

Sets or returns the contents of the OPERation INSTrument Enable Register. Even though this is a 16-bit register, only 15 bits (bit 0 through bit 14) are used. Bit 15 always reads 0.
Syntax

STATus:OPERation:INSTRument:ENABle <NRf>
STATus:OPERation:INSTRument:ENABle?

Parameters

<NR1> is an integer from 0 to 32767.

Returns

<NR1>

Examples

STATus:OPERation:INSTRument:ENABle 32767 sets all 15 bits of the register high.
STATus:OPERation:INSTRument:ENABle? returns 0 if all 15 bits of the register are low.

STATus:OPERation:INSTRument[:EVENT]?

Returns and clears the contents of the OPERation INSTRument register. The response is a decimal value that summarizes the binary values of the set bits.

Syntax

STATus:OPERation:INSTRument[:EVENT]?

Returns

<NR1>

Examples

STATus:OPERation:INSTRument[:EVENT]? returns 0.

STATus:OPERation:INSTRument:ISUMmary<n>:CONDition? (Query Only)

Returns the contents of the OPERation INSTRument ISUMmary<n> register. The PS2520G and PS2521G Programmable Power Supplies, however, do not use the OPERation INSTRument ISUMmary<n> register to report any conditions.
Reading the OPERation INSTRument ISUMmary\(<n>\) register does not affect its contents.

**Syntax**

```
STATus:OPERation:INSTrument:ISUMmary\(<n>\)::CONDition?
```

**Returns**

0

**Examples**

```
STATus:OPERation:INSTrument:ISUMmary1::CONDition?
```

returns 0.

**STATus:OPERation:INSTrument:ISUMmary\(<n>\)::ENABle**

Sets or returns the contents of the OPERation INSTRument ISUMmary\(<n>\) Enable Register. Even though this is a 16-bit register, only 15 bits (bit 0 through bit 14) are used. Bit 15 always reads 0.

**Syntax**

```
STATus:OPERation:INSTrument:ISUMmary\(<n>\)::ENABle <NR1>
STATus:OPERation:INSTrument:ISUMmary\(<n>\)::ENABle?
```

**Parameters**

\(<NR1>\) is an integer from 0 to 32767.

**Returns**

\(<NR1>\)

**Examples**

```
STATus:OPERation:INSTrument:ISUMmary1::ENABle 32767
```

sets all 15 bits of the register high.

```
STATus:OPERation:INSTrument:ISUMmary1::ENABle?
```

returns 0 if all 15 bits of the register are low.
STATus:OPERation:INStrument:ISUMmary<n>[:EVENt]?

Returns and clears the contents of the OPERation INStrument ISUMmary<n> register. The response is a decimal value that summarizes the binary values of the set bits.

Syntax

```
STATus:OPERation:INStrument:ISUMmary<n>[:EVENt]?
```

Returns

```
<NR1>
```

Examples

```
STATus:OPERation:INStrument:ISUMmary1:EVENt? returns 0.
```

STATus:PRESet (No Query Form)

Sets the OPERation and QUESTionable enable registers to zeros, the INStrument enable registers to ones, and ISUMmary registers to zeros.

Syntax

```
STATus:PRESet
```

STATus:QUEue[:NEXT]? (Query Only)

Reads the next item from the Error and Event Queue. Refer to the error codes in Table 11 on page 55. This query is identical to the SYStem:ERRor? query.

Syntax

```
STATus:QUEue[:NEXT]?
```

Returns

```
<NR1>,<string>
```
Examples

STATus:QUEue? returns 0, "No error" if there are no errors in the queue.

STATus:QUESTionable:CONDition? (Query Only)

Returns the contents of the QUESTionable condition register. Reading the QUESTionable condition register does not affect its contents. This query returns a decimal value that summarizes the binary values of the set bits.

Syntax

STATus:QUESTionable:CONDition?

Returns

<NR1>

STATus:QUESTionable:ENABle

Sets or returns the contents of the enable register for the QUESTionable event register. Even though this is a 16-bit register, only 15 bits (bit 0 through bit 14) are used. Bit 15 always reads 0.

Syntax

STATus:QUESTionable:ENABle <NR1>
STATus:QUESTionable:ENABle?

Parameters

<NR1> is a positive integer from 0 to 32767.

Returns

<NR1>

Examples

STATus:QUESTionable:ENABle 32767 sets all 15 bits of the register high.

STATus:QUESTionable:ENABle? returns 0 if all 15 bits of the register are low.
STATus:QUESTionable[:EVENt]?

Returns and clears the contents of the QUESTionable event register. Reading the QUESTionable register using the query form resets the register. The query returns a decimal value that summarizes the binary values of the set bits.

Syntax

```plaintext
STATus:QUESTionable[:EVENt]?
```

Returns

```plaintext
<NRI>
```

Examples

```plaintext
STATus:QUESTionable:EVENt? returns 2 if bit number 1 is the only bit set.
```

STATus:QUESTionable:INSTRument:CONDition? (Query Only)

Returns the contents of the QUESTionable INSTRument condition register. Reading the QUESTionable INSTRument condition register does not affect its contents. This query returns a decimal value that summarizes the binary values of the set bits.

Syntax

```plaintext
STATus:QUESTionable:INSTRument:CONDition?
```

Returns

```plaintext
<NRI>
```

STATus:QUESTionable:INSTRument:ENABle

Sets or returns the contents of the enable register for the QUESTionable INSTRument event register. Even though this is a 16-bit register, only 15 bits (bit 0 through bit 14) are used. Bit 15 always reads 0.
Syntax

```
STATus:QUEStionable:INStrument:ENABle <NR1>
STATus:QUEStionable:INStrument:ENABle?
```

Parameters

- `<NR1>` is a positive integer from 0 to 32767.

Returns

- `<NR1>`

Examples

- `STATus:QUEStionable:INStrument:ENABle 32767` sets all 15 bits of the register high.
- `STATus:QUEStionable:INStrument:ENABle?` returns 0 if all 15 bits of the register are low.

---

**STATus:QUEStionable:INStrument[:EVENt]??**

Returns and clears the contents of the QUEStionable INStrument event register. Reading the QUEStionable INStrument register using the query form resets the register. The query returns a decimal value that summarizes the binary values of the set bits.

Syntax

```
STATus:QUEStionable:INStrument[:EVENt]?
```

Returns

- `<NR1>`

Examples

- `STATus:QUEStionable:INStrument[:EVENt]?` returns 2 if bit number 1 is the only bit set.

---

**STATus:QUEStionable:INStrument:ISUMmary<n> :CONDition? (Query Only)**

Returns the contents of the QUEStionable INStrument ISUMmary<n> condition register. Reading the QUEStionable INStrument
ISUMmary\textsubscript{n} condition register does not affect its contents. This query returns a decimal value that summarizes the binary values of the set bits.

**Syntax**

\[
\text{STATus:QUEStionable:INSTrument:ISUMmary}\textsubscript{n}::\text{CONDition}\?
\]

**Returns**

\(<\text{NR1}\>

**STATus:QUEStionable:INSTrument:ISUMmary\textsubscript{n}::\text{ENABle}**

Sets or returns the contents of the enable register for the QUEStionable INSTrument ISUMmary\textsubscript{n} event register. Even though this is a 16-bit register, only 15 bits (bit 0 through bit 14) are used. Bit 15 always reads 0.

**Syntax**

\[
\text{STATus:QUEStionable:INSTrument:ISUMmary}\textsubscript{n}::\text{ENABle} <\text{NR1}>
\]

\[
\text{STATus:QUEStionable:INSTrument:ISUMmary}\textsubscript{n}::\text{ENABle}?
\]

**Parameters**

\(<\text{NR1}\> \text{ is a positive integer from 0 to 32767.}

**Returns**

\(<\text{NR1}\>

**Examples**

\[
\text{STATus:QUEStionable:INSTrument:ISUMmary}\textsubscript{n}::\text{ENABle} 32767
\]

sets all 15 bits of the register high.

\[
\text{STATus:QUEStionable:INSTrument:ISUMmary}\textsubscript{n}::\text{ENABle}\? \text{ returns 0 if all 15 bits of the register are low.}
\]

**STATus:QUEStionable:INSTrument:ISUMmary\textsubscript{n}::\text{EVENt}?**

Returns and clears the contents of the QUEStionable INSTrument event register. Reading the QUEStionable INSTrument register using
the query form resets the register. The query returns a decimal value that summarizes the binary values of the set bits.

**Syntax**

\[
\text{STATus:QUESTIONable:INStrument:ISUMmary}<n>[:EVENt]? 
\]

**Returns**

\[
<NR1> 
\]

**Examples**

STATus:QUESTIONable:INStrument:ISUMmary\(<n>\):EVENt? returns 2 if bit number 1 is the only bit set.

---

**STB? (Query Only)**

Returns the contents of the Status Byte Register (SBR) using the Master Summary Status (MSS) bit. Refer to Figure 10 on page 49.

**Syntax**

\[
*\text{STB}? 
\]

**Returns**

\[
<NR1> 
\]

**Examples**

*STB? returns \(96\) if the SBR contains the binary value \(0110\ 0000\).

---

**SYSTem:AUTO**

Sets or returns automatic sequence setting.

**Syntax**

\[
\text{SYSTem:AUTO} \ <\text{Boolean}> \\
\text{SYSTem:AUTO} ? 
\]
Syntax: 0 | 1 | OFF | ON
OFF or 0 sets AUTO off, ON or 1 sets AUTO on.

Returns
0 | 1

Examples
SYSTem:AUTO 1 sets AUTO SEQ on.

SYSTem:ERRor? (Query Only)
Reads the next item from the Error and Event Queue. Refer to the error codes in Table 11 on page 55. This query is identical to the SYSTem:QUEue[:NEXT]? query.

Syntax
SYSTem:ERRor?

Returns
<string>

Examples
SYSTem:ERRor? returns -300,"Device-specific error; overvoltage protection error" if the overvoltage protection circuit has disabled the outputs.

SYSTem:VERSion? (Query Only)
Returns the SCPI version to which the power supply complies.

Syntax
SYSTem:VERSion?

Returns
1994.0
**Syntax and Commands**

---

**TST? (Query Only)**

Tests RAM, ROM, DAC, and ADC components.

**Syntax**

* TST?

**Returns**

0 | −300

**Examples**

* TST?  returns 0 if the test is successful.

* TST?  returns −300 if the test fails.

**WAI (No Query Form)**

The IEEE 488.2 standard requires the WAI command as part of the standard command set. WAI prevents the programmable instrument from executing further commands or queries until all pending operations finish. This command, however, does not serve a useful function on the PS2520G and PS2521G Programmable Power Supplies. The power supplies do not have any operations that require additional time to finish.

**Syntax**

* WAI

---
Status and Events

The PS2520G and PS2521G Programmable Power Supplies provide a status and event reporting system for the GPIB interface. Various registers and queues make up this system. This section explains how these registers and queues work to inform you of significant events.

System Structure

Figure 7 on page 43 is a simplified diagram of the status and event reporting system. In reality, each component of the diagram represents a set of registers and queues that read, report, or enable the occurrence of certain events within the system.

Status reporting begins when a specific event in the programmable power supply sets a bit in a status register. Reading the status registers tells you what types of events have occurred.

Each bit in the status register corresponds to a bit in an enable register; the enable bit must be high for the event to be reported to the Status Byte Register.

The Output Queue stores and reports query responses. The Error/Event Queue stores and reports error messages.

A Service Request (SRQ) is the last event to occur. The SRQ requests an interrupt on the GPIB to report events to the system controller.

The following sections explain the registers and queues in greater detail.
Figure 6: QUEStionable INStrument Registers
IEEE 488 Registers

Status Register (IEEE-488.2)

Status Byte (IEEE-488.1)

OPERation Status (SCPI)

Output Queue (IEEE-488.1)

Error/Event Queue

Figure 7: Status and Event System
Status Registers

The programmable power supplies use status registers that are defined by SCPI, IEEE-488.1, and IEEE-488.2 standards.

SCPI Status Registers

The power supplies include two status registers defined by the SCPI standard:

- OPERation Status Registers (CONDition, EVENt, and ENABle)
- QUEStionable Status Registers (CONDition, EVENt, and ENABle)

The STATus subsystem (Figure 8) is the hierarchical set of commands that read the SCPI defined status registers.

Figure 8: STATus Hierarchy of SCPI Defined Registers

The lower-level nodes :OPERation and :QUEStionable each have three 16-bit registers: CONDition, EVENt, and ENABle. Figure 9 shows the sequential relationship between these three types of registers and the commands that relate to each register.
The CONDition register is a read-only register that monitors the current state of the instrument. The CONDition register updates in real time and the inputs are not latched or buffered. When a condition monitored by the CONDition register becomes true, the bit for that condition also becomes true (1). When the condition is false, the bit is 0.

The read-only EVENt register latches any false-to-true change in condition. Once the bit in the EVENt register is set, it is no longer affected by changes in the corresponding bit of the CONDition register. The bit remains set until the controller reads it. The command *CLS (Clear Status) clears the EVENt registers.

ENABle registers control the reporting of events latched in the EVENt registers. The QUEStionable Enable Register, for example, sets the summary bit (3) of the Status Byte Register true only if one or more of the bits in the QUEStionable Event Register are true. The programmable power supply can assert SRQ (Service Request) on the GPIB only after the ENABle register sets the summary bit true.

**OPERation Status Registers.** Although the OPERation Status Registers are present, the programmable power supplies do not use them to report any status information.
**QUEStionable Status Register.** Table 6 shows the bit designations of the 16 bit QUEStionable Status Register.

<table>
<thead>
<tr>

</table>

The command `STATUs:QUESTIONable:INStrument:CONDition?` reads the Questionable Instrument CONDITION register but does not clear it.

The command `STATUs:QUESTIONable:INStrument[:EVENT]?` reads and clears the Questionable Instrument EVENT Status Register.

**Questionable INStrument ISUMmary<n> Status Register.** Table 8 shows the bit designations of the three 16-bit Questionable INStrument ISUMmary<n> Status Registers (ISUMmary1, ISUMmary2, and ISUMmary3).
### Table 8: QUEStionable INSTrument ISUMmary\(<n>\) Status Register

The command `STATus:QUEStionable:INSTRument:ISUMmary\(<n>\):CONDition?` reads the QUEStionable INSTrument ISUMmary\(<n>\) CONDition register but does not clear it.

The command `STATus:QUEStionable:INSTRument:ISUMmary\(<n>\)[:,EVENT]?` reads and clears the QUEStionable INSTrument ISUMmary\(<n>\) EVENt Status Register.
IEEE-488.1 and IEEE-488.2 Status Registers

The power supplies also include two status registers defined by IEEE-488.1 and IEEE-488.2 standards:

- Status Byte Register (SBR)
- Standard Event Status Register (SESR)

**Status Byte Register (SBR).** The SBR (Figure 10) summarizes the status of all other registers and queues.

![Figure 10: Status Byte Register (SBR)](image)

Use a serial poll or the *STB?* query to read the contents of the SBR. The bits in the SBR are set and cleared depending on the contents of the Standard Event Status Register (SESR), the Event Status Enable Register (ESER), and the Output Queue. When you use a serial poll to obtain the SBR, bit 6 is the MSS bit. Reading the SBR does not clear the bits.

Table 9 explains the function of each bit in the SBR.
### Table 9: SBR Bit Functions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (LSB)</td>
<td>Not used. This bit is always zero.</td>
</tr>
<tr>
<td>1</td>
<td>Not used. This bit is always zero.</td>
</tr>
<tr>
<td>2</td>
<td>E/E (Error and Event) indicates an error code is waiting to be read in the Error Event Queue</td>
</tr>
<tr>
<td>3</td>
<td>QUES (QUEStionable) is the summary bit for the QESR (QUEStionable Event Status Register). When this bit is high it indicates that status is enabled and present in the QESR.</td>
</tr>
<tr>
<td>4</td>
<td>MAV (Message Available) indicates that output is available in the output queue.</td>
</tr>
<tr>
<td>5</td>
<td>ESB (Event Status Bit) is the summary bit for the Standard Event Status Register (SESR). When this bit is high it indicates that status is enabled and present in the SESR.</td>
</tr>
<tr>
<td>6</td>
<td>RQS (Request Service) is obtained from a serial poll. This bit shows that the power supply requests service from the GPIB controller. MSS (Master Status Summary) is obtained from *STB? query. This bit indicates another bit in the SBR has been enabled and is set.</td>
</tr>
<tr>
<td>7 (MSB)</td>
<td>OPER (OPERation) is the summary bit for the OESR (OPERation EVENt Status Register). This bit is never set in the PS2520G and PS2521G Programmable Power Supplies.</td>
</tr>
</tbody>
</table>

### Standard Event Status Register (SESR)

Figure 11 shows the SESR. The SESR records five types of events that can occur within the power supply.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>OPC</td>
</tr>
<tr>
<td>1</td>
<td>QYE</td>
</tr>
<tr>

</tr>
<tr>
<td>6</td>
<td>PON</td>
</tr>
</tbody>
</table>

Figure 11: The Standard Event Status Register (SESR)
Use the \(*\text{ESR}\) query to read the SESR. Reading the SESR clears the bits of the register so that the register can accumulate information about new events.

Table 10 explains the function of each bit in the SESR.

### Table 10: SESR Bit Functions

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (LSB)</td>
<td>OPC (Operation Complete) shows that the operation is complete. This bit is set when all pending operations are completed following an *OPC command.</td>
</tr>
<tr>
<td>1</td>
<td>Not used. This bit is always zero.</td>
</tr>
<tr>
<td>2</td>
<td>QYE (Query Error) indicates a command or query protocol error. Error messages are listed in Table 11 (&quot;–4XX&quot; errors).</td>
</tr>
<tr>
<td>3</td>
<td>DDE (Device Error) shows that a device error occurred. Error messages are listed in Table 11 (&quot;–3XX&quot; errors).</td>
</tr>
<tr>
<td>4</td>
<td>EXE (Execution Error) shows that an error occurred while the power supply was executing a command or query. Table 11 lists the error messages (&quot;–2XX&quot; errors).</td>
</tr>
<tr>
<td>5</td>
<td>CME (Command Error) shows that an error occurred while the power supply was parsing a command or query. Table 11 on page 55 lists the error messages (&quot;–1XX&quot; errors).</td>
</tr>
<tr>
<td>6</td>
<td>USR (User Request) indicates the LOCAL button was pushed.</td>
</tr>
<tr>
<td>7 (MSB)</td>
<td>PON (Power On) shows that the power supply was powered on.</td>
</tr>
</tbody>
</table>
Enable Registers

The enable registers determine whether certain events are reported to the Status Byte Register and SRQ. The programmable power supply has the following enable registers:

- Event Status Enable Register (ESER)
- Service Request Enable Register (SRER)
- OPERation Enable Register
- QUESTionable Enable Register

The enable registers perform a logical OR function; when one of the bits of the enable registers is high and the corresponding bit in the status register is high, the output that controls the set bit of the Status Byte Register is high.

Various commands set the bits in the enable registers. The following sections describe the enable registers and the commands that set them.

**Event Status Enable Register (ESER)**

The ESER (Figure 12) controls which types of events are summarized by the Event Status Bit (ESB) in the SBR. The bits of the ESER correspond to the bits of the SESR. Refer to Table 10 on page 51 for an explanation of each bit in the SESR.

Use the *ESE* command to set the bits in the ESER. Use the *ESE?* query to read it.

```
<table>
<thead>
<tr>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>PON</td>
<td>USR</td>
<td>CME</td>
<td>EXE</td>
<td>DDE</td>
<td>QYE</td>
<td>—</td>
<td>OPC</td>
</tr>
</tbody>
</table>
```

**Figure 12: Event Status Enable Register (ESER)**

**Service Request Enable Register (SRER)**

The SRER (Figure 13) controls which bits in the SBR generate a service request.
Use the *SRE command to set the SRER. Use the *SRE? query to read it.

The bits of the SRER correspond to the bits of the SBR. Refer to Table 9 on page 50 for an explanation of each bit in the SBR.

<table>
<thead>
<tr>
<th>Bit</th>

</tr>
<tr>
<td>3</td>
<td>QUES</td>
</tr>
<tr>
<td>2</td>
<td>E/E</td>
</tr>
<tr>
<td>1</td>
<td>—</td>
</tr>
<tr>
<td>0</td>
<td>—</td>
</tr>
</tbody>
</table>

**Figure 13: Service Request Enable Register (SRER)**

**OPERation Enable Register**

Even though the OPERation Enable Register is present in the programmable power supplies, the OPERation registers do not report any conditions.

**QUEStionable Enable Register**

The QUEStionable Enable Register controls which types of events are summarized by the QUES status bit in the SBR. Use the STATus:QUEStionable:ENABle command to set the bits in the QUEStionable Enable register. Use the STATus:QUEStionable:ENABle? query to read it. Refer to Table 6 on page 46 for a description of each of the bits in this register.
Queues

The programmable power supplies contain two queues: the Output Queue and the Error/Event queue.

Output Queue

Following IEEE 488.2 protocols, the programmable power supplies store query responses in the Output Queue. The power supply clears and resets this queue each time it receives a new command or query message after a message terminator. The controller must read a query response before it sends the next command (or query) or it loses responses to earlier queries.

Error/Event Queue

When an error or event occurs, the Error/Event Queue stores the message and sets bit 2 of the Status Byte Register high. Enabling this bit by using the *SRE 4 command causes the event to signal the GPIB controller with a Service Request (SRQ) signal.

The Error/Event Queue stores and reports the messages on a first-in-first-out basis. The SYSTEM:ERROR? or the STATUS:QUEUE [:NEXT]? query reads the next item from the Error/Event Queue. If the Error/Event Queue overflows, the last message is −350, "Queue overflow"; the queue cannot store or report subsequent messages until it is read or cleared.

Error Messages

Table 11 lists the SCPI error messages for the programmable power supplies. The listing includes the equivalent front-panel error code along with a description of the error message.
Table 11: Error Messages
